assoc.domains ................................................................. 2
assoc.domains

Association measures between domains in multidimensional sequence analysis

Description
Computes various measures of association between dimensions of multidimensional sequence data.

Usage
assoc.domains(dlist, names, djsa)

Arguments

dlist  A list of dissimilarity matrices or dist objects (see dist), with one element per dimension of the multidimensional sequence data

names  A character vector of the names of the dimensions of the multidimensional sequence data

djsa    A dissimilarity matrix or a dist object (see dist), corresponding to the distances between the multidimensional sequences

Author(s)
Nicolas Robette

References
**Examples**

```r
library(TraMineR)
data(biofam)

## Building one channel per type of event (left, children or married)
bf <- as.matrix(biofam[, 10:25])
children <- bf==4 | bf==5 | bf==6
married <- bf == 2 | bf== 3 | bf==6
left <- bf==1 | bf==3 | bf==5 | bf==6

## Building sequence objects
child.seq <- seqdef(children)
marr.seq <- seqdef(married)
left.seq <- seqdef(left)

## Using Hamming distance
mcdist <- seqdistmc(channels=list(child.seq, marr.seq, left.seq),
                      method="HAM")
child.dist <- seqdist(child.seq, method="HAM")
marr.dist <- seqdist(marr.seq, method="HAM")
left.dist <- seqdist(left.seq, method="HAM")

## Association between domains
asso <- assoc.domains(list(child.dist,marr.dist,left.dist), c('child', 'marr', 'left'), mcdist)
asso
```

**seq2qha**

*Recoding sequences for qualitative harmonic analysis*

**Description**

Recodes sequence data into the shape used for qualitative harmonic analysis.

**Usage**

```r
seq2qha(seqdata, periods)
```

**Arguments**

- `seqdata` a sequence object (see `seqdef` function).
- `periods` numeric vector of the first positions of the periods used for recoding

**Value**

A data frame with one column by combination of period and state (i.e. number of columns = number of periods * number of states in the alphabet).
Author(s)

Nicolas Robette

References

Examples

data(trajact)
seqact <- seqdef(trajact)
qha <- seq2qha(seqact, periods=c(1,3,7,12,24))
head(qha)

Description

A data frame describing mothers employment histories from age 14 to 60 and daughters employment histories from the completion of education to 15 years later. Sequences are sampled (N = 400) from "Biographies et entourage" survey (INED, 2001).

Usage

data("seqgimsa")

Format

A data frame with 400 observations and 62 numeric variables. The first 15 variables (prefixed 'f') describe the daughters employment status a given year : 1 = education, 2 = inactivity, 3 = part-time job, 4 = full-time job. The following 47 variables (prefixed 'm') describe the mothers employment status at a given age : 1 = self-employment, 3 = higher level or intermediate occupation, 5 = lower level occupation, 8 = inactivity, 9 = education.

Examples

data(seqgimsa)
str(seqgimsa)
seqi1epi

At least one episode in the states

Description

Returns whether each sequence comprises at least one episode in the states.

Usage

seqi1epi(seqdata)

Arguments

seqdata a sequence object (see seqdef function).

Author(s)

Nicolas Robette

References

See Also

seqistatd, seqinepi, seqifpos

Examples

data(trajact)
seqact <- seqdef(trajact)
stat <- seqi1epi(seqact)
head(stat)

seqifpos

First position in each state

Description

Returns the first position in each state.

Usage

seqifpos(seqdata)
Arguments

seqdata a sequence object (see seqdef function).

Author(s)

Nicolas Robette

References

See Also

seqistatd, seqilepi, seqinepi

Examples

```r
data(trajact)
seqact <- seqdef(trajact)
stat <- seqifpos(seqact)
head(stat)
```

---

<table>
<thead>
<tr>
<th>seqinepi</th>
<th>Number of episodes in each state</th>
</tr>
</thead>
</table>

Description

Returns the number of episodes in the states.

Usage

```r
seqinepi(seqdata)
```

Arguments

seqdata a sequence object (see seqdef function).

Author(s)

Nicolas Robette

References

seqmds.stress

See Also
seqistatd, seqilepi, seqifpos

Examples

data(trajact)
seqact <- seqdef(trajact)
stat <- seqinepi(seqact)
head(stat)

seqmds.stress  Stress measure of multidimensional scaling factors

Description
Computes stress measure of multidimensional scaling data for different number of dimensions of
the represented space

Usage
seqmds.stress(seqdist, mds)

Arguments
seqdist  a dissimilarity matrix or a dist object (see dist)
mds  a matrix with coordinates in the represented space (dimension 1 in column 1,
dimension 2 in column 2, etc.)

Value
A numerical vector of stress values.

Author(s)
Nicolas Robette

References

Examples

data(trajact)
seqact <- seqdef(trajact)
dissim <- seqdist(seqact, method="HAM")
mds <- cmdscale(dissim, k=20, eig=TRUE)
stress <- seqmds.stress(dissim, mds)
plot(stress, type='l', xlab='number of dimensions', ylab='stress')
seqmsa

Sample of marital, parental and residential sequences

Description

A data frame describing respectively the matrimonial, parental and residential status from age 14 to age 35. It’s sampled (N=500) from "Biographies et entourage" survey (INED, 2001).

Usage

data("seqmsa")

Format

A data frame with 500 observations and 66 variables. The first 22 variables (prefixed 'log') describe the residential status at a given age: 0 = not independent, 1 = independent. The next 22 variables (prefixed 'mat') describe the matrimonial status at a given age: 1 = never been in a relationship, 2 = cohabiting union, 3 = married, 4 = separated. The last 22 variables (prefixed 'nenf') describe the parental status at a given age: 0 = no child, 1 = one child, 2 = two children, 3 = three children or more.

Examples

data(seqmsa)
str(seqmsa)

seqsmooth

Smoothing sequence data

Description

Smoothing of sequence data, using for each sequence the medoid of the sequences in its neighborhood. The results can be used to get a smoothed index plot.

Usage

seqsmooth(seqdata, diss, k=20, r=NULL)

Arguments

seqdata a sequence object (see seqdef function).
diss a dissimilarity matrix, giving the pairwise distances between sequences.
k size of the neighborhood. Default is 20.
r radius of the neighborhood. If NULL (default), the radius is not used for smoothing.
Value

A list with the following elements:

- seqdata: a sequence object (see seqdef function)
- R2: pseudo-R2 measure of the goodness of fit of the smoothing
- S2: stress measure of the goodness of fit of the smoothing

Author(s)

Nicolas Robette

References

Examples

```r
data(trajact)
seqact <- seqdef(trajact)
dissim <- seqdist(seqact, method="LCS")
mds <- cmdscale(dissim, k=1)
smoothed <- seqsmooth(seqact, dissim, k=30)$seqdata
seqIplot(smoothed, sortv=mds, xtlab=14:50, with.legend=FALSE, yaxis=FALSE, ylab=NA)
```

seq_heatmap

**Index plot of sequences ordered according to a dendrogram**

Description

Index plot of state sequences. Sequences are ordered according to the specified dendrogram. The dendrogram is also plotted on the side of the index plot.

Usage

```r
seq_heatmap(seq, tree, with.missing = FALSE, ...)
```

Arguments

- seq: a state sequence object created with the seqdef function
- tree: a dendrogram of the sequences (an object of class hclust, dendrogram or agnes)
- with.missing: is there a ’missing value’ state in the sequences?
- ...: additional parameters sent to heatmap

seqIplot

Examples

if (require(TraMineR)) {
  data(mvad)
  mvad.seq <- seqdef(mvad[,17:86])
  mvad.lcs <- seqdist(mvad.seq, method = "LCS")
  mvad.hc <- hclust(as.dist(mvad.lcs), method = "ward.D2")
  seq_heatmap(mvad.seq, mvad.hc)
}

socdem Sample of sociodemographic variables

Description

A data frame with sociodemographic variables for a sample of 500 interviewees from "Biographies et entourage" survey (INED, 2001).

Usage

data("socdem")

Format

A data frame with 500 observations on the following 9 variables.

annais year of birth (numeric)
nbenf number of children (factor)
nbunion number of relationships (factor)
mereactive whether mother was active or not (factor)
sexe gender (factor)
PCS occupational category (factor)
PCSpere occupational category of the father (factor)
diplome degree (factor)
nationalite nationality (factor)

Examples

data(socdem)
str(socdem)
symPLS

Symmetric (or canonical) PLS

Description

Computes symmetric (or canonical) PLS for two groups of continuous variables

Usage

symPLS(a,b)

Arguments

a  data frame of the first group of continuous variables
b  data frame of the second group of continuous variables

Author(s)

Nicolas Robette, Xavier Bry

References

traject

Sample of employment histories

Description

A data frame describing the employment status from age 14 to age 50. It's a sample of 500 interviewees from "Biographies et entourage" survey (INED, 2001).

Usage

data("traject")

Format

A data frame with 500 observations and 37 variables. Each variable is numeric and describes the employment status at a given age: 1 = education, 2 = full-time job, 3 = part-time job, 4 = small jobs, 5 = inactivity, 6 = military service.

Examples

data(traject)
str(traject)
