Package ‘sgPLS’

August 29, 2017

Type Package
Title Sparse Group Partial Least Square Methods
Version 1.7
Date 2017-08-29
Author Benoit Liquet and Pierre Lafaye de Micheaux and Camilo Broc
Maintainer Benoit Liquet <b.liquet@uq.edu.au>
Depends mixOmics, mvtnorm
License GPL (>= 2.0)
NeedsCompilation no
Repository CRAN
Date/Publication 2017-08-29 11:53:00 UTC

The sgPLS package provides sparse, group and sparse group version for PLS approaches. The main functions are: \texttt{spls} for sparse PLS, \texttt{gpls} for group PLS and \texttt{sgpls} for sparse group PLS.

**Description**

The sgPLS package provides sparse, group and sparse group version for PLS approaches. The main functions are: \texttt{spls} for sparse PLS, \texttt{gpls} for group PLS and \texttt{sgpls} for sparse group PLS.

**Details**

**gPLS**

**Description**

Function to perform group Partial Least Squares (gPLS) in the context of two datasets which are both divided into groups of variables. The gPLS approach aims to select only a few groups of variables from one dataset which are linearly related to a few groups of variables of the second dataset.

**Usage**

```r
gPLS(X, Y, ncomp, mode = "regression",
     max.iter = 500, tol = 1e-06, keepX,
     keepY = NULL, ind.block.x, ind.block.y = NULL, scale=TRUE)
```

**Arguments**

- **X** numeric matrix of predictors.
- **Y** numeric vector or matrix of responses (for multi-response models).
- **ncomp** the number of components to include in the model (see Details).
- **mode** character string. What type of algorithm to use, (partially) matching one of "regression" or "canonical". See Details.
- **max.iter** integer, the maximum number of iterations.
- **tol** a positive real, the tolerance used in the iterative algorithm.
- **keepX** numeric vector of length ncomp, the number of variables to keep in X-loadings. By default all variables are kept in the model.
- **keepY** numeric vector of length ncomp, the number of variables to keep in Y-loadings. By default all variables are kept in the model.
- **ind.block.x** a vector of integers describing the grouping of the X-variables. (see an example in Details section)
- **ind.block.y** a vector of consecutive integers describing the grouping of the Y-variables (see an example in Details section)
- **scale** a logical indicating if the original data set need to be scaled. By default scale=TRUE

**Details**

The **gPLS** function fits gPLS models with 1,\ldots,ncomp components. Multi-response models are fully supported.

The type of algorithm to use is specified with the mode argument. Two gPLS algorithms are available: gPLS regression ("regression") and gPLS canonical analysis ("canonical") (see References).

```r
ind.block.x <- c(3,10,15) means that X is structured into 4 groups: X1 to X3; X4 to X10, X11 to X15 and X16 to Xp where p is the number of variables in the X matrix.
```
gPLS returns an object of class "gPLS", a list that contains the following components:

- **X**: the centered and standardized original predictor matrix.
- **Y**: the centered and standardized original response vector or matrix.
- **ncomp**: the number of components included in the model.
- **mode**: the algorithm used to fit the model.
- **keepX**: number of X variables kept in the model on each component.
- **keepY**: number of Y variables kept in the model on each component.
- **mat.c**: matrix of coefficients to be used internally by predict.
- **variates**: list containing the variates.
- **loadings**: list containing the estimated loadings for the X and Y variates.
- **names**: list containing the names to be used for individuals and variables.
- **tol**: the tolerance used in the iterative algorithm, used for subsequent S3 methods.
- **max.iter**: the maximum number of iterations, used for subsequent S3 methods.
- **iter**: vector containing the number of iterations for convergence in each component.
- **ind.block.x**: a vector of integers describing the grouping of the X variables.
- **ind.block.y**: a vector of consecutive integers describing the grouping of the Y variables.

**Author(s)**

Benoit Liquet and Pierre Lafaye de Micheaux.

### gPLS model
model.gPLS <- gPLS(X, Y, ncomp = 2, mode = "regression", keepX = c(4, 4),
                keepY = c(4, 4), ind.block.x = ind.block.x, ind.block.y = ind.block.y)

result.gPLS <- select.sgpls(model.gPLS)
result.gPLS$group.size.X
result.gPLS$group.size.Y
```
gPLSda  

*Group Sparse Partial Least Squares Discriminant Analysis (sPLS-DA)*

**Description**

Function to perform group Partial Least Squares to classify samples (supervised analysis) and select variables.

**Usage**

```r
gPLSda(x, y, ncomp = 2, keepX = rep(ncol(X), ncomp),
max.iter = 500, tol = 1e-06, ind.block.x)
```

**Arguments**

- `x` numeric matrix of predictors. NAs are allowed.
- `y` a factor or a class vector for the discrete outcome.
- `ncomp` the number of components to include in the model (see Details).
- `keepX` numeric vector of length ncomp, the number of variables to keep in X-loadings. By default all variables are kept in the model.
- `max.iter` integer, the maximum number of iterations.
- `tol` a positive real, the tolerance used in the iterative algorithm.
- `ind.block.x` a vector of integers describing the grouping of the X-variables. (see an example in Details section)

**Details**

The `gPLSda` function fits gPLS models with 1, \ldots, ncomp components to the factor or class vector `y`. The appropriate indicator (dummy) matrix is created.

```r
ind.block.x <- c(3, 10, 15) means that X is structured into 4 groups: X1 to X3; X4 to X10, X11 to X15 and X16 to Xp where p is the number of variables in the X matrix.
```

**Value**

`sPLSda` returns an object of class "sPLSda", a list that contains the following components:

- `X` the centered and standardized original predictor matrix.
- `y` the centered and standardized indicator response vector or matrix.
- `ind.mat` the indicator matrix.
- `ncomp` the number of components included in the model.
- `keepX` number of X variables kept in the model on each component.
- `mat.c` matrix of coefficients to be used internally by `predict`.
- `variates` list containing the variates.
**per.variance**

- **loadings**: list containing the estimated loadings for the $X$ and $Y$ variates.
- **names**: list containing the names to be used for individuals and variables.
- **tol**: the tolerance used in the iterative algorithm, used for subsequent S3 methods.
- **max.iter**: the maximum number of iterations, used for subsequent S3 methods.
- **iter**: Number of iterations of the algorithm for each component.
- **ind.block.x**: a vector of integers describing the grouping of the $X$ variables.

**Author(s)**

Benoit Liquet and Pierre Lafaye de Micheaux.

**Examples**

```r
data(simudata)
X <- simudata$X
Y <- simudata$Y
ind.block.x <- seq(100, 900, 100)
model <- gPLSda(X, Y, ncomp = 3, ind.block.x=ind.block.x, keepX = c(2, 2, 2))
result.gPLSda <- select.sgpls(model)
result.gPLSda$group.size.X

# perf(model, criterion="all", validation="loo") -> res
# res$error.rate
```

| per.variance | Percentage of variance of the $Y$ matrix explained by the score-vectors obtained by PLS approaches |

**Description**

The `per.variance` function computes the percentage of variance of the $Y$ matrix explained by the score-vectors obtained by PLS approaches (sPLS, gPLS or sgPLS) in a regression mode.
Usage

per.variance(object)

Arguments

object object of class inheriting from "sPLS", "gPLS", or "sgPLS". The function will retrieve some key parameters stored in that object.

Value

per.variance produces a list with the following components:

- perX Percentage of variance of the Y matrix explained by each score-vectors.
- cum.perX The cumulative of the percentage of variance of the Y matrix explained by the score-vectors.

perf

Compute evaluation criteria for PLS, sPLS, PLS-DA and sPLS-DA

Description

Function to evaluate the performance of the fitted sparse PLS, group PLS, sparse group PLS, sparse PLS-DA, group PLS-DA and sparse group PLS-DA models using various criteria.

Usage

## S3 method for class 'sPLS'

perf(object,
    criterion = c("all", "MSEP", "R2", "Q2"),
    validation = c("Mfold", "loo"),
    folds = 10, progressBar = TRUE, setseed = 1,...)
## S3 method for class 'gPLS'

```r
perf(object, 
    criterion = c("all", "MSEP", "R2", "Q2"), 
    validation = c("Mfold", "loo"), 
    folds = 10, progressBar = TRUE, setseed = 1, ...)
```

## S3 method for class 'sgPLS'

```r
perf(object, 
    criterion = c("all", "MSEP", "R2", "Q2"), 
    validation = c("Mfold", "loo"), 
    folds = 10, progressBar = TRUE, setseed = 1, ...)
```

## S3 method for class 'sPLSda'

```r
perf(object, 
    method.predict = c("all", "max.dist", "centroids.dist", "mahalanobis.dist"), 
    validation = c("Mfold", "loo"), 
    folds = 10, progressBar = TRUE, ...)
```

## S3 method for class 'gPLSda'

```r
perf(object, 
    method.predict = c("all", "max.dist", "centroids.dist", "mahalanobis.dist"), 
    validation = c("Mfold", "loo"), 
    folds = 10, progressBar = TRUE, ...)
```

## S3 method for class 'sgPLSda'

```r
perf(object, 
    method.predict = c("all", "max.dist", "centroids.dist", "mahalanobis.dist"), 
    validation = c("Mfold", "loo"), 
    folds = 10, progressBar = TRUE, ...)
```

### Arguments

- **object**: Object of class inheriting from "sPLS", "gPLS", "sgPLS", "sPLSda", "gPLSda" or "sgPLSda". The function will retrieve some key parameters stored in that object.

- **criterion**: The criteria measures to be calculated (see Details). Can be set to either "all", "MSEP", "R2", "Q2". By default set to "all". Only applies to an object inheriting from "sPLS", "gPLS" or "sgPLS".

- **method.predict**: only applies to an object inheriting from "PLSda", "gPLSda" or "sgPLSda" to evaluate the classification performance of the model. Should be a subset of "max.dist", "centroids.dist", "mahalanobis.dist". Default is "all". See `predict`. 

---

**Arguments**

- **object**: Object of class inheriting from "sPLS", "gPLS", "sgPLS", "sPLSda", "gPLSda" or "sgPLSda". The function will retrieve some key parameters stored in that object.

- **criterion**: The criteria measures to be calculated (see Details). Can be set to either "all", "MSEP", "R2", "Q2". By default set to "all". Only applies to an object inheriting from "sPLS", "gPLS" or "sgPLS".

- **method.predict**: only applies to an object inheriting from "PLSda", "gPLSda" or "sgPLSda" to evaluate the classification performance of the model. Should be a subset of "max.dist", "centroids.dist", "mahalanobis.dist". Default is "all". See `predict`. 

validation Character. What kind of (internal) validation to use, matching one of "Mfold" or "loo" (see below). Default is "Mfold".

folds The folds in the Mfold cross-validation. See Details.

progressBar By default set to TRUE to output the progress bar of the computation.

setseed Integer value to specify the random generator state.

... Not used at the moment.

Details

The method perf has been created by Sebastien Dejean, Ignacio Gonzalez, Amrit Singh and Kim-Anh Le Cao for pls and spls models performed by mixOmics package. Similar code has been adapted for sPLS, gPLS and sgPLS in the package sgPLS.

perf estimates the mean squared error of prediction (MSEP), $R^2$, and $Q^2$ to assess the predictive performance of the model using M-fold or leave-one-out cross-validation. Note that only the classic, regression and invariant modes can be applied.

If validation = "Mfold", M-fold cross-validation is performed. How many folds to generate is selected by specifying the number of folds in folds. The folds also can be supplied as a list of vectors containing the indexes defining each fold as produced by split. If validation = "loo", leave-one-out cross-validation is performed.

For fitted sPLS-DA, gPLS-DA and sgPLS-DA models, perf estimates the classification error rate using cross-validation.

Note that the perf function will retrieve the keepX and keepY inputs from the previously run object. The sPLS, gPLS, sgPLS, sPLSda, gPLSda or sgPLSda functions will be run again on several and different subsets of data (the cross-folds) and certainly on different subset of selected features. For sPLS, the MSEP, $R^2$, and $Q^2$ criteria are averaged across all folds. A feature stability measure is output for the user to assess how often the variables are selected across all folds. For sPLS-DA, the classification error rate is averaged across all folds.

Value

perf produces a list with the following components:

- **MSEP** Mean Square Error Prediction for each $Y$ variable, only applies to object inherited from "sPLS", "gPLS" and "sgPLS".
- **R2** a matrix of $R^2$ values of the $Y$-variables for models with 1, ..., ncomp components, only applies to object inherited from "sPLS", "gPLS" and "sgPLS".
- **Q2** if $Y$ contains one variable, a vector of $Q^2$ values else a list with a matrix of $Q^2$ values for each $Y$-variable. Note that in the specific case of an sPLS model, it is better to have a look at the Q2.total criterion, only applies to object inherited from from "sPLS", "gPLS" and "sgPLS".
- **Q2.total** a vector of $Q^2$-total values for models with 1, ..., ncomp components, only applies to object inherited from from "sPLS", "gPLS" and "sgPLS".
- **features** a list of features selected across the folds ($stable.X$ and $stable.Y$) or on the whole data set ($final$) for the keepX and keepY parameters from the input object.
For sPLS-DA, gPLS-DA and sgPLS-DA models, `perf` produces a matrix of classification error rate estimation. The dimensions correspond to the components in the model and to the prediction method used, respectively. Note that error rates reported in any component include the performance of the model in earlier components for the specified `keepX` parameters (e.g. error rate reported for component 3 for `keepX = 20` already includes the fitted model on components 1 and 2 for `keepX = 20`). For more advanced usage of the `perf` function, see [www.mixomics.org/methods/spls-da/](http://www.mixomics.org/methods/spls-da/) and consider using the `predict` function.

**Examples**

```r
## validation for objects of class 'sPLS' (regression)
## Example from mixOmics package
# -------------------------------
## Not run:
data(liver.toxicity)
X <- liver.toxicity$gene
Y <- liver.toxicity$clinic

## validation for objects of class 'spls' (regression)
# -------------------------------
ncomp <- 7
# first, learn the model on the whole data set
model.spls <- sPLS(X, Y, ncomp = ncomp, mode = 'regression',
                   keepX = c(rep(5, ncomp)), keepY = c(rep(2, ncomp)))

# with leave-one-out cross validation
set.seed(45)
model.spls.loo.val <- perf(model.spls, validation = "loo")
```
plotcim       

Plots a cluster image mapping of correlations between outcomes and all predictors

Description

The plotcim function plots a cluster image mapping of correlations between outcomes and all the predictors.

Usage

plotcim(matX, matY, cexCol = 0.5, cexRow = 1)

Arguments

matX    data frame corresponding to the predictors.
matY    data frame corresponding to the outcomes.
cexRow, cexCol    positive numbers, used as cex.axis in for the row or column axis labeling. The defaults currently only use number of rows or columns, respectively.

Details

To be used with a small number of predictors (<1,000).

predict  

Predict Method for sPLS, gPLS, sgPLS, sPLDda, gPLSda, sgPLSda

Description

Predicted values based on sparse PLS, group PLS, sparse group PLS, sparse PLSda, group PLSDa, sparse group PLSDa models. New responses and variates are predicted using a fitted model and a new matrix of observations.

Usage

```r
## S3 method for class 'sPLS'
predict(object, newdata, ...)  
## S3 method for class 'gPLS'
predict(object, newdata, ...)  
## S3 method for class 'sgPLS'
predict(object, newdata, ...)  
## S3 method for class 'sPLDda'
predict(object, newdata, method = c("all", "max.dist", "centroids.dist", "mahalanobis.dist"), ...)  
## S3 method for class 'gPLSda'
predict(object, newdata, method = c("all", "max.dist", "centroids.dist", "mahalanobis.dist"), ...)  
## S3 method for class 'sgPLSda'
predict(object, newdata, method = c("all", "max.dist", "centroids.dist", "mahalanobis.dist"), ...)  
```

Arguments

- `object`: object of class inheriting from "sPLS", "gPLS", "sgPLS", "sPLDda", "gPLSda" or "sgPLSda".
- `newdata`: data matrix in which to look for for explanatory variables to be used for prediction.
- `method`: method to be applied for sPLSda, gPLSda or sgPLSda to predict the class of new data, should be a subset of "centroids.dist", "mahalanobis.dist" or "max.dist" (see Details). Defaults to "all".
- `...`: not used currently.
The predict function for pls and spls object has been created by Sebastien Dejean, Ignacio Gonzalez, Amrit Singh and Kim-Anh Le Cao for mixOmics package. Similar code is used for sPLS, gPLS, sgPLS, sPLSda, gPLSda, sgPLSda models performed by sgPLS package.

predict function produces predicted values, obtained by evaluating the sparse PLS, group PLS or sparse group PLS model returned by sPLS, gPLS or sgPLS in the frame newdata. Variates for newdata are also returned. The prediction values are calculated based on the regression coefficients of object$Y$ onto object$X$.

Different class prediction methods are proposed for sPLSda, gPLSda or sgPLSda: "max.dist" is the naive method to predict the class. It is based on the predicted matrix (object$\text{predict}$) which can be seen as a probability matrix to assign each test data to a class. The class with the largest class value is the predicted class. "centroids.dist" allocates the individual $x$ to the class of $Y$ minimizing $dist(x-\text{variate}, G_l)$, where $G_l, l = 1, ..., L$ are the centroids of the classes calculated on the $X$-variates of the model. "mahalanobis.dist" allocates the individual $x$ to the class of $Y$ as in "centroids.dist" but by using the Mahalanobis metric in the calculation of the distance.

Value

**predict** produces a list with the following components:

- **predict**: A three dimensional array of predicted response values. The dimensions correspond to the observations, the response variables and the model dimension, respectively.
- **variates**: Matrix of predicted variates.
- **B.hat**: Matrix of regression coefficients (without the intercept).
- **class**: vector or matrix of predicted class by using 1, ..., ncomp (sparse)PLS-DA components.
- **centroids**: matrix of coordinates for centroids.

select.sgpls

Output of selected variables from a gPLS model or a sgPLS model

Description
This function outputs the selected variables on each component for the group and sparse group PLS.

Usage
select.sgpls(model)

Arguments
model object of class inheriting from "gPLS" or "sgPLS".

Value
select.sgpls produces a list with the following components:

- group.size.X: A matrix containing in the first column the size of the groups in the X dataset. Then, the next columns indicate the size of the groups selected for each component.
- select.group.X: A list containing for each element (corresponding to each group of the X dataset) the indices of the variables selected.
- group.size.Y: A matrix containing in the first column the size of the groups in the Y dataset. Then, the next columns indicate the size of the groups selected for each component.
- select.group.Y: A list containing for each element (corresponding to each group of the Y dataset) the indices of the variables selected.
- select.X: A list containing for each element (corresponding to each component of the gPLS or sgPLS model) the names of the selected variables in the X dataset.
- select.Y: A list containing for each element (corresponding to each component of the gPLS or sgPLS model) the names of the selected variables in the Y dataset.
- select.X.total: The names of the variables selected from the gPLS or sgPLS model regarding the X matrix.
- select.Y.total: The names of the variables selected from the gPLS or sgPLS model regarding the Y matrix.

## End(Not run)

select.spls  

Output of selected variables from a sPLS model

Description

This function outputs the selected variables on each component for the sPLS.

Usage

select.spls(model)

Arguments

model object of class inheriting from "sPLS".

Value

select.spls produces a list with the following components:

select.X A list containing for each element (corresponding to each component of the sPLS model) the names of the selected variables in the X matrix.

select.Y A list containing for each element (corresponding to each component of the sPLS model) the names of the selected variables in the Y matrix.

select.X.total The names of the variables selected from the sPLS model regarding the X matrix.

select.Y.total The names of the variables selected from the sPLS model regarding the Y matrix.

### sPLS model

model.sPLS <- sPLS(X, Y, ncomp = 2, mode = "regression", keepX = c(60, 60),
              keepY = c(60, 60))
result.sPLS <- select.spls(model.sPLS)
result.sPLS$select.X
result.sPLS$select.Y

## End(Not run)
Description

Function to perform sparse group Partial Least Squares (sgPLS) in the context of datasets are divided into groups of variables. The sgPLS approach enables selection at both groups and single feature levels.

Usage

sgPLS(x, Y, ncomp, mode = "regression",
max.iter = 500, tol = 1e-06, keepX,
keepY = NULL, ind.block.x, ind.block.y = NULL, alpha.x, alpha.y = NULL,
upper.lambda = 10 ^ 5, scale=TRUE)

Arguments

X Numeric matrix of predictors.
Y Numeric vector or matrix of responses (for multi-response models).
ncomp The number of components to include in the model (see Details).
mode character string. What type of algorithm to use, (partially) matching one of "regression" or "canonical". See Details.
max.iter Integer, the maximum number of iterations.
tol A positive real, the tolerance used in the iterative algorithm.
keepX Numeric vector of length ncomp, the number of variables to keep in X-loadings. By default all variables are kept in the model.
keepY Numeric vector of length ncomp, the number of variables to keep in Y-loadings. By default all variables are kept in the model.
ind.block.x A vector of integers describing the grouping of the X variables. (see an example in Details section).
ind.block.y A vector of integers describing the grouping of the Y variables (see example in Details section).
alpha.x The mixing parameter (value between 0 and 1) related to the sparsity within group for the X dataset.
alpha.y The mixing parameter (value between 0 and 1) related to the sparsity within group for the Y dataset.
upper.lambda By default upper.lambda=10 ^ 5. A large value specifying the upper bound of the interval of lambda values for searching the value of the tuning parameter (lambda) corresponding to a non-zero group of variables.
scale a logical indicating if the original data set need to be scaled. By default scale=TRUE
Details

sgPLS function fit gPLS models with 1,...,ncomp components. Multi-response models are fully supported.

The type of algorithm to use is specified with the mode argument. Two gPLS algorithms are available: gPLS regression ("regression") and gPLS canonical analysis ("canonical") (see References).

ind.block.x <- c(3, 10, 15) means that X is structured into 4 groups: X1 to X3; X4 to X10, X11 to X15 and X16 to Xp where p is the number of variables in the X matrix.

Value

sgPLS returns an object of class "sgPLS", a list that contains the following components:

X The centered and standardized original predictor matrix.
Y The centered and standardized original response vector or matrix.
ncomp The number of components included in the model.
mode The algorithm used to fit the model.
keepX Number of X variables kept in the model on each component.
keepY Number of Y variables kept in the model on each component.
mat.c Matrix of coefficients to be used internally by predict.
variates List containing the variates.
loadings List containing the estimated loadings for the X and Y variates.
names List containing the names to be used for individuals and variables.
tol The tolerance used in the iterative algorithm, used for subsequent S3 methods.
max.iter The maximum number of iterations, used for subsequent S3 methods.
iter Vector containing the number of iterations for convergence in each component.
ind.block.x A vector of integers describing the grouping of the X variables.
ind.block.y A vector of consecutive integers describing the grouping of the Y variables.
alpha.x The mixing parameter related to the sparsity within group for the X dataset.
alpha.y The mixing parameter related to the sparsity within group for the Y dataset.
upper.lambda The upper bound of the intervall of lambda values for searching the value of the tuning parameter (lambda) corresponding to a non-zero group of variables.

**sgPLS-internal**  
**Internal Functions**

**Description**

Internal functions not to be used by the user.

---

**sgPLSda**  
**Sparse Group Sparse Partial Least Squares Discriminant Analysis (sPLS-DA)**

**Description**

Function to perform sparse group Partial Least Squares to classify samples (supervised analysis) and select variables.

**Usage**

sgPLSda(X, Y, ncomp = 2, keepX = rep(ncol(X), ncomp), max.iter = 500, tol = 1e-06, ind.block.x, alpha.x, upper.lambda = 10 ^ 5)
Arguments

- **X**: numeric matrix of predictors. NAs are allowed.
- **Y**: a factor or a class vector for the discrete outcome.
- **ncomp**: the number of components to include in the model (see Details).
- **keepX**: numeric vector of length ncomp, the number of variables to keep in X-loadings. By default all variables are kept in the model.
- **max.iter**: integer, the maximum number of iterations.
- **tol**: a positive real, the tolerance used in the iterative algorithm.
- **ind.block.x**: a vector of integers describing the grouping of the X-variables. (see an example in Details section)
- **alpha.x**: The mixing parameter (value between 0 and 1) related to the sparsity within group for the X dataset.
- **upper.lambda**: By default upper.lambda=10^-5. A large value specifying the upper bound of the intervall of lambda values for searching the value of the tuning parameter (lambda) corresponding to a non-zero group of variables.

Details

`sgPLSda` function fit sgPLS models with 1,...,ncomp components to the factor or class vector Y. The appropriate indicator (dummy) matrix is created.

`ind.block.x <- c(3,10,15)` means that X is structured into 4 groups: X1 to X3; X4 to X10, X11 to X15 and X16 to Xp where p is the number of variables in the X matrix.

Value

`sPLSda` returns an object of class "sPLSda", a list that contains the following components:

- **X**: the centered and standardized original predictor matrix.
- **Y**: the centered and standardized indicator response vector or matrix.
- **ind.mat**: the indicator matrix.
- **ncomp**: the number of components included in the model.
- **keepX**: number of X variables kept in the model on each component.
- **mat.c**: matrix of coefficients to be used internally by `predict`.
- **variates**: list containing the variates.
- **loadings**: list containing the estimated loadings for the X and Y variates.
- **names**: list containing the names to be used for individuals and variables.
- **tol**: the tolerance used in the iterative algorithm, used for subsequent S3 methods
- **max.iter**: the maximum number of iterations, used for subsequent S3 methods
- **iter**: Number of iterations of the algorithm for each component
- **ind.block.x**: a vector of integers describing the grouping of the X variables.
- **alpha.x**: The mixing parameter related to the sparsity within group for the X dataset.
- **upper.lambda**: The upper bound of the intervall of lambda values for searching the value of the tuning parameter (lambda) corresponding to a non-zero group of variables.

```r
data(simudata)
X <- simudata$X
Y <- simudata$Y
ind.block.x <- seq(100, 900, 100)
ind.block.x[2] <- 250
#To add some noise in the second group
model <- sgPLSda(X, Y, ncomp = 3, ind.block.x=ind.block.x, keepX = c(2, 2, 2),
alpha.x = c(0.5, 0.5, 0.99))
result.sgPLSda <- select.sgpls(model)
result.sgPLSda$group.size.X
#perf(model,criterion="all",validation="loo") -> res
#res$error.rate
```

---

**simuData**

*Simulated Data for group PLS-DA model*

**Description**

This simulated data set contains the expression of 1000 genes for 4 clusters from 48 different individuals.

**Usage**

`data(simudata)`

**Format**

A list containing the following components:

- `X` data matrix with 48 rows and 1000 columns. Each row represents an experimental sample, and each column a single gene.
- `Y` a factor variable indicating the cluster of each subject.
Details

This data have been simulated such that only 6 groups of 100 genes are linked to the 4 clusters. The others 4 groups of 100 genes has been added to represent some noise. The relevant groups are the group 1,2,4,6,7 and 9. The groups 3,5,8, and 10 are noise groups.

---

**sPLS**

**Sparse Partial Least Squares (sPLS)**

Description

Function to perform sparse Partial Least Squares (sPLS). The sPLS approach combines both integration and variable selection simultaneously on two data sets in a one-step strategy.

Usage

```r
spls(x, y, ncomp, mode = "regression", max.iter = 500, tol = 1e-06, keepX = rep(ncol(x), ncomp), keepY = rep(ncol(y), ncomp), scale=TRUE)
```

Arguments

- **x** Numeric matrix of predictors.
- **y** Numeric vector or matrix of responses (for multi-response models).
- **ncomp** The number of components to include in the model (see Details).
- **mode** Character string. What type of algorithm to use, (partially) matching one of "regression" or "canonical". See Details.
- **max.iter** Integer, the maximum number of iterations.
- **tol** A positive real, the tolerance used in the iterative algorithm.
- **keepX** Numeric vector of length ncomp, the number of variables to keep in X-loadings. By default all variables are kept in the model.
- **keepY** Numeric vector of length ncomp, the number of variables to keep in Y-loadings. By default all variables are kept in the model.
- **scale** a logical indicating if the original data set need to be scaled. By default scale=TRUE

Details

sPLS function fit sPLS models with 1,...,ncomp components. Multi-response models are fully supported.

Sparse Partial Least Squares Discriminant Analysis (sPLS-DA)

Description

Function to perform sparse Partial Least Squares to classify samples (supervised analysis) and select variables.

Usage

sPLSda(x, y, ncomp = 2, keepX = rep(ncol(X), ncomp),
       max.iter = 500, tol = 1e-06)

Arguments

X
numeric matrix of predictors. NAs are allowed.

Y
a factor or a class vector for the discrete outcome.
ncomp
the number of components to include in the model (see Details).
keepX
numeric vector of length ncomp, the number of variables to keep in X-loadings. By default all variables are kept in the model.
max.iter
integer, the maximum number of iterations.
tol
a positive real, the tolerance used in the iterative algorithm.

Details

sPLSda function fit sPLS models with 1, . . . , ncomp components to the factor or class vector Y. The appropriate indicator (dummy) matrix is created.

Value

sPLSda returns an object of class "sPLSda", a list that contains the following components:

X
the centered and standardized original predictor matrix.

Y
the centered and standardized indicator response vector or matrix.

ind.mat
the indicator matrix.
ncomp
the number of components included in the model.
keepX
number of X variables kept in the model on each component.
mat.c
matrix of coefficients to be used internally by predict.

variates
list containing the variates.

loadings
list containing the estimated loadings for the X and Y variates.
names
list containing the names to be used for individuals and variables.
tol
the tolerance used in the iterative algorithm, used for subsequent S3 methods

max.iter
the maximum number of iterations, used for subsequent S3 methods

iter
Number of iterations of the algorithm for each component

X <- as.matrix(liver.toxicity$gene)
# Y will be transformed as a factor in the function, 
# but we set it as a factor to set up the colors.
Y <- as.factor(liver.toxicity$treatment[4])
model <- sPLSda(X, Y, ncomp = 2, keepX = c(20, 20))
```

---

**tuning.gPLS.X**  
*Choice of the tuning parameter (number of groups) related to predictor matrix for gPLS model (regression mode)*

Description

For a grid of tuning parameter, this function computes by leave-one-out or M-fold cross-validation the MSEP (Mean Square Error of Prediction) of a gPLS model.

Usage

```r
tuning.gPLS.X(X, Y, folds=10, validation=c("Mfold","loo"),
ncomp,keepX=NULL,grid.X,setseed,progressBar=FALSE,
ind.block.x=ind.block.x)
```
Arguments

- **X**: Numeric matrix or data frame \((n \times p)\), the observations on the \(X\) variables.
- **Y**: Numeric matrix or data frame \((n \times q)\), the observations on the \(Y\) variables.
- **folds**: Positive integer. Number of folds to use if validation="mfold". Defaults to folds=10.
- **validation**: Character string. What kind of (internal) cross-validation method to use, (partially) matching one of "mfold" (M-folds) or "loo" (leave-one-out).
- **ncomp**: Number of component for investigating the choice of the tuning parameter.
- **keepX**: Vector of integer indicating the number of group of variables to keep in each component. See details for more information.
- **grid.X**: Vector of integers defining the values of the tuning parameter (corresponding to the number of group of variables to select) at which cross-validation score should be computed.
- **setseed**: Integer indicating the random number generation state.
- **progressBar**: By default set to FALSE to output the progress bar of the computation.
- **ind.block.x**: A vector of integers describing the grouping of the \(X\) variables. (see an example in details section)

Details

If validation="mfold", M-fold cross-validation is performed by calling mfold. The folds are generated. The number of cross-validation folds is specified with the argument folds.

If validation="loo", leave-one-out cross-validation is performed by calling the loo function. In this case the arguments folds are ignored.

If keepX is specified (by default is NULL), each element of keepX indicates the value of the tuning parameter for the corresponding component. Only the choice of the tuning parameters corresponding to the remaining components are investigating by evaluating the cross-validation score at different values defining by grid.X.

Value

The returned value is a list with components:

- **MSEP**: Matrix containing the cross-validation score computed on the grid.
- **keepX**: Value of the tuning parameter (lambda) on which the cross-validation method reached its minimum.

ind.block.x = ind.block.x)
```
tuning.sgPLS.X

## Description

For a grid in two dimension of tuning parameters, this function computes by leave-one-out or M-fold cross-validation the MSEP (Mean Square Error of Prediction) of a sgPLS model.

## Usage

```r
tuning.sgPLS.X(x, y, folds = 10, validation = c("Mfold", "loo"), ncomp, keepX = NULL, alpha.x = NULL, grid.gX, grid.alpha.X, setseed, progressBar = FALSE, ind.block.x = ind.block.x, upper.lambda = 10^9)
```

## Arguments

- `x` Numeric matrix or data frame \((n \times p)\), the observations on the \(X\) variables.
- `y` Numeric matrix or data frame \((n \times q)\), the observations on the \(Y\) variables.
- `folds` Positive integer. Number of folds to use if `validation`="Mfold". Defaults to `folds`=10.
- `validation` Character string. What kind of (internal) cross-validation method to use, (partially) matching one of "Mfold" (M-folds) or "loo" (leave-one-out).
- `ncomp` Number of component for investigating the choice of the tuning parameter.
- `keepX` Vector of integer indicating the number of group of variables to keep in each component. See Details for more information.
- `alpha.x` Numeric vector indicating the number of group of variables to keep in each component. See Details for more information.
- `grid.gX, grid.alpha.X` Vector numeric defining the values of tuning parameter lambda (number of groups to select) and tuning parameter alpha (mixing parameter values between 0 and 1) at which cross-validation score should be computed
- `setseed` Integer indicating the random number generation state.
- `progressBar` By default set to FALSE to output the progress bar of the computation.
- `ind.block.x` A vector of integers describing the grouping of the \(X\) variables. (see an example in Details section).
- `upper.lambda` By default `upper.lambda`=10^9. A large value specifying the upper bound of the interval of lambda values for searching the value of the tuning parameter (lambda) corresponding to a non-zero group of variables.
Details

If validation = "Mfolds", M-fold cross-validation is performed by calling mfold. The folds are generated. The number of cross-validation folds is specified with the argument folds.

If validation = "loo", leave-one-out cross-validation is performed by calling the loo function. In this case the arguments folds are ignored.

If keepX is specified (by default is NULL), each element of keepX indicates the value of the tuning parameter for the corresponding component. Only the choice of the tuning parameters corresponding to the remaining components are investigating by evaluating the cross-validation score at different values defining by grid.X.

If alpha.x is specified (by default is NULL), each element of alpha.x indicates the value of the tuning parameter (alpha) for the corresponding component. Only the choice of the tuning parameters corresponding to the remaining components are investigating by evaluating the cross-validation score at different values defining by grid.alpha.X.

Value

The returned value is a list with components:

- **MSEP** vector containing the cross-validation score computed on the grid
- **keepX** value of the tuning parameter on which the cross-validation method reached it minimum.
- **alphaX** value of the tuning parameter (alpha) on which the cross-validation method reached it minimum.

**tuning.sPLS.X**

Choice of the tuning parameter (number of variables) related to predictor matrix for sPLS model (regression mode)
Description

For a grid of tuning parameter, this function computes by leave-one-out or M-fold cross-validation the MSEP (Mean Square Error of Prediction) of a sPLS model.

Usage

tuning.sPLS.X(x, Y, folds = 10, validation = c("Mfold", "loo"), ncomp,
keepX = NULL, grid.X, setseed, progressBar = FALSE)

Arguments

X  Numeric matrix or data frame \((n \times p)\), the observations on the \(X\) variables.
Y  Numeric matrix or data frame \((n \times q)\), the observations on the \(Y\) variables.
folds  Positive integer. Number of folds to use if validation="Mfold". Defaults to folds=10.
validation  Character string. What kind of (internal) cross-validation method to use, (partially) matching one of "Mfolds" (M-folds) or "loo" (leave-one-out).
ncomp  Number of component for investigating the choice of the tuning parameter.
keepX  Vector of integer indicating the number of variables to keep in each component. See Details for more information.
grid.X  Vector of integers defining the values of the tuning parameter (corresponding to the number of variables to select) at which cross-validation score should be computed.
setseed  Integer indicating the random number generation state.
progressBar  By default set to FALSE to output the progress bar of the computation.

Details

If validation="Mfolds", M-fold cross-validation is performed by calling Mfold. The folds are generated. The number of cross-validation folds is specified with the argument folds.

If validation="loo", leave-one-out cross-validation is performed by calling the loo function. In this case the arguments folds are ignored.

if keepX is specified (by default is NULL), each element of keepX indicates the value of the tuning parameter for the corresponding component. Only the choice of the tuning parameters corresponding to the remaining components are investigating by evaluating the cross-validation score at different values defining by grid.X.

Value

The returned value is a list with components:

MSEP  Vector containing the cross-validation score computed on the grid
keepX  Value of the tuning parameter on which the cross-validation method reached it minimum.
