Functions for plotting graphical shapes, colors

Description

Functions for plotting graphical shapes such as ellipses, circles, cylinders, arrows, ...

Details

Package: shape
Type: Package
Version: 1.3.4
Date: 2011-07-30
License: GNU Public License 3 or above

This package is used in R-package ecolMod, which includes many more examples.

See also R-package diagram.

Changes in version 1.3.4: more consistent drawing of ellipse and circle segments, (functions getellipse, getcircle), added textflag. (both suggested by Tom Wilson)

Author(s)

Karline Soetaert (Maintainer)

```r
## Not run:
## show examples (see respective help pages for details)
example(rotatexy)
example(filledshape)

## run demos
demo("colorshapes") # creating colored shapes

## open the directory with source code of demos
browseURL(paste(system.file(package="shape"), "/demo", sep=""))

## show package vignette
vignette("shape")
edit(vignette("shape"))
browseURL(paste(system.file(package="shape"), "/doc", sep=""))

## End(Not run)
```

---

### A4

opens A4-sized window

---

**Description**

opens a graphics window, 8.5 inches wide, 11 inches high

**Usage**

`A4 (...)`

**Arguments**

... arguments passed to R-function X11.

**Author(s)**

Karline Soetaert <karline.soetaert@nioz.nl>
**Arrowhead**

*adds arrowheads to a plot*

**Description**

adds one or more arrowheads to a plot; shape is either curved, a triangle, a circle or ellipse.

**Usage**

```r
Arrowhead(x0, y0, angle = 0, arr.length = 0.4,
           arr.width = arr.length/2, arr.adj = 0.5,
           arr.type = "curved", lcol = "black", lty = 1,
           arr.col = lcol, arr.lwd = 2, npoint = 5, ...)
```

**Arguments**

- `x0`: x-coordinates of points at which to draw arrowhead; either one value or a vector.
- `y0`: y-coordinates of points at which to draw arrowhead; either one value or a vector.
- `angle`: angle of arrowhead (anti-clockwise, relative to x-axis), in degrees \([0,360]\); either one value or a vector.
- `arr.length`: approximate length of arrowhead, in cm; either one value or a vector.
- `arr.width`: approximate width of arrowhead, in cm; either one value or a vector.
- `arr.adj`: 0, 0.5, 1 specifying the adjustment of the arrowhead.
- `arr.type`: type of arrowhead to draw, one of "curved", "triangle", "circle", "ellipse".
- `lcol`: line color specifications; either one value or a vector.
- `lty`: line type specifications; either one value or a vector.
- `arr.col`: color of arrowhead; either one value or a vector.
- `arr.lwd`: line width of arrowhead.
- `npoint`: only if `arr.type` = "curved": number of points to draw the curve; increase for smoother arrowheads.
- `...`: arguments passed to the `polygon` function.

**Details**

- `x0`, `y0`, `angle`, `arr.length`, `arr.width`, `lcol`, `lty` and `arr.col` can be a vector, of the same length.
  - if `arr.adj = 0.5`, then the centre of the arrowhead is at the point at which it is drawn.
  - `arr.adj = 1` causes the tip of the arrowhead to touch the point.
  - `arr.adj = 0` causes the base of the arrowhead to touch the point.

The type of the arrowhead is set with `arr.type` which can take the values:

- "triangle": uses filled triangle
- "curved": draws arrowhead with curved edges
- "circle": draws circular head (where `arr.width=arr.length`)
- "ellipse": draws ellipsoid head
Arrows

Arrows

Examples

```r
emptyplot(main = "Arrowhead")
Arrowhead(x0 = runif(10), y0 = runif(10), angle = runif(10)*360,
  arr.length = 0.3, arr.type = "circle", arr.col = "green")
Arrowhead(x0 = runif(10), y0 = runif(10), angle = runif(10)*360,
  arr.length = 0.4, arr.type = "curved", arr.col = "red")
Arrowhead(x0 = runif(10), y0 = runif(10), angle = runif(10)*360,
  arr.length = runif(10), arr.type = "triangle",
  arr.col = rainbow(10))
```

Description

adds one or more arrows to a plot; arrowhead shape is either curved, a triangle, a circle or simple

Usage

```r
Arrows(x0, y0, x1, y1, code = 2, arr.length = 0.4,
  arr.width = arr.length/2, arr.adj = 0.5, arr.type = "curved",
  segment = TRUE, col = "black", lcol = col, lty = 1, arr.col = lcol,
  lwd = 1, arr.lwd = lwd, ...)
```

Arguments

- `x0`: x-coordinates of points *from* which to draw arrows; either one value or a vector.
- `y0`: y-coordinates of points *from* which to draw arrows; either one value or a vector.
- `x1`: x-coordinates of points *to* which to draw arrows; either one value or a vector.
- `y1`: y-coordinates of points *to* which to draw arrows; either one value or a vector.
- `code`: integer code determining kind of arrows to draw.
- `arr.length`: approximate length of arrowhead, in cm; either one value or a vector.
- `arr.width`: approximate width of arrowhead, in cm; either one value or a vector.
- `arr.adj`: 0,0.5,1 specifying the adjustment of the arrowhead.
arr.type  type of arrowhead to draw, one of "none", "simple", "curved", "triangle", "circle", "ellipse" or "T".

arr.length  logical specifying whether or not to draw line segments.

col  general line color specification; one value or a vector.

lcol  line color specifications; either one value or a vector. ignored when arr.type = "simple" or "T" - use "col"

lty  line type specifications; either one value or a vector.

arr.col  color of arrowhead; either one value or a vector.

lwd  general line width specification. The default value changed to 1 from version 1.4 (was 2)

arr.lwd  line width of arrowhead.

...  arguments passed to lines, segments or Arrowhead function.

Details

x0, y0, x1, y1, arr.length, arr.width, arr.adj, col, lcol and arr.col can be a vector, of the same length.

For each 'i', an arrow is drawn between the point '(x0[i], y0[i])' and the point '(x1[i],y1[i])'.

  • If code=1 an arrowhead is drawn at '(x0[i],y0[i])'
  • if code=2 an arrowhead is drawn at '(x1[i],y1[i])'.
  • If code=3 an arrowhead is drawn at both ends of the arrow
  • unless arr.length = 0, when no head is drawn.

  • If arr.adj = 0.5 then the centre of the arrowhead is at the point at which it is drawn.
  • arr.adj = 1 causes the tip of the arrowhead to touch the point.
  • arr.adj = 2 causes the base of the arrowhead to touch the point.

The type of the arrowhead is set with arr.type which can take the values:

  • "simple" : uses comparable R function arrows
  • "triangle": uses filled triangle
  • "curved" : draws arrowhead with curved edges
  • "circle" : draws circular head
  • "ellipse" : draws ellipseoid head
  • "T" : draws T-shaped (blunt) head

Examples

```r
xlim <- c(-5, 5)
ylim <- c(-10, 10)
plot(0, type = "n", xlim = xlim, ylim = ylim,
    main = "Arrows, type = 'curved'")
x0 <- runif(100, xlim[1], xlim[2])
y0 <- runif(100, ylim[1], ylim[2])
x1 <- x0 + runif(100, -1, 1)
y1 <- y0 + runif(100, -1, 1)
Arrows(x0, y0, x1, y1, arr.length = runif(100), code = 2,
    arr.type = "curved", arr.col = 1:100, lcol = 1:100)

plot(0, type = "n", xlim = xlim, ylim = ylim,
    main = "Arrows, type = 'circle'")
x0 <- runif(100, xlim[1], xlim[2])
y0 <- runif(100, ylim[1], ylim[2])
x1 <- x0 + runif(100, -1, 1)
y1 <- y0 + runif(100, -1, 1)
Arrows(x0, y0, x1, y1, arr.length = 0.2, code = 3,
    arr.type = "circle", arr.col = "grey")

plot(0, type = "n", xlim = xlim, ylim = ylim,
    main = "Arrows, type = 'ellipse'")
Arrows(x0, y0, x1, y1, arr.length = 0.2, arr.width = 0.5,
    code = 3, arr.type = "ellipse", arr.col = "grey")

curve(expr = sin(x), 0, 2*pi+0.25, main = "Arrows")
x <- seq(0, 2*pi, length.out = 10)
xd <- x + 0.025
Arrows(x, sin(x), xd, sin(xd), type = "triangle",
    arr.length = 0.5, segment = FALSE)

xx <- seq(0, 10*pi, length.out = 1000)
plot(sin(xx)*xx, cos(xx)*xx, type = "l", axes = FALSE,
    xlab = "", ylab = "", main = "Arrows, type = 'curved'")
x <- seq(0, 10*pi, length.out = 20)
x1 <- sin(x)*x
y1 <- cos(x)*x
xd <- x+0.01
x2 <- sin(xd)*xd
y2 <- cos(xd)*xd
Arrows(x1, y1, x2, y2, arr.type = "curved", arr.length = 0.4,
    segment = FALSE, code = 1, arr.adj = 0.5)

plot(sin(xx)*xx, cos(xx)*xx, type = "l", axes = FALSE,
    xlab = "", ylab = "", main = "Arrows, type = 'T'")
Arrows(x1, y1, x2, y2, arr.type = "T", arr.length = 0.4,
    code = 1, arr.lwd = 2)

# arguments passed to polygon:
```
```r
xlim <- c(-5, 5)
ylim <- c(-10, 10)
plot(0, type = "n", xlim = xlim, ylim = ylim,
     main = "Arrows, type = 'curved'")
x0 <- runif(100, xlim[1]-1, xlim[2]+0.5) # exceeds the x-range
y0 <- runif(100, ylim[1], ylim[2])
x1 <- x0+runif(100, -1, 1)
y1 <- y0+runif(100, -1, 1)
Arrows(x0, y0, x1, y1, arr.length = runif(100), code = 2,
       arr.type = "curved", arr.col = 1:100, lcol = 1:100, xpd = TRUE)
```

---

colorlegend (adds a color legend to a plot.

**Description**

Adds a color legend to a plot.

**Usage**

```r
colorlegend(col = femmecol(100), zlim, zlevels = 5, dz = NULL,
            zval = NULL, log = FALSE, posx = c(0.9, 0.93),
            posy = c(0.05, 0.9), main = NULL, main.cex = 1.0,
            main.col = "black", lab.col = "black",
            digit = 0, left = FALSE, ...)
```

**Arguments**

- `col` color palette to be used; also allowed are two extremes or one value.
- `zlim` two-valued vector, the minimum and maximum z values.
- `zlevels` number of z-levels, one value, ignored if `dz` or `zval` not equal to `NULL`.
- `dz` increment in legend values, one value; ignored if `zval` not equal to `NULL`.
- `zval` a vector of z-values to label legend.
- `log` logical indicating whether to log transform or not.
- `posx` relative position of left and right edge of color bar on first axis, [0,1].
- `posy` relative position on lower and upper edge of color bar on second axis, [0,1].
- `main` main title, written above the color bar.
- `main.cex` relative size of main title.
- `main.col` color of main title.
- `lab.col` color of labels.
- `digit` number of significant digits in labels.
- `left` logical indicating whether to put the labels on the right (TRUE) or on the left (FALSE).
- `...` arguments passed to R-function `text` when writing labels.
cylindersegment

adds part of a cylinder to a plot

description

adds a segment of a cylinder to a plot

usage

cylindersegment(rx = 1, ry = rx, from = pi, to = 3*pi/2, len = 1,
mid = c(0,0), angle = 0, dr = 0.01, col = "black",
delt = 1.0, ...)

arguments

rx horizontal radius of full cylinder.
ry vertical radius of full cylinder.
from start radius of segment, radians.
to end radius of segment, radians.
len cylinder length.
mid midpoint of cylinder.
drapecol

draping colors over a persp plot

description

generates color(s) that will appear on the surface facets of a "persp" plot.

usage

drapecol(A, col = femmecol(100), NAcol = "white", lim = NULL)
emptyplot

Arguments

  A  matrix with input grid.
  col  color palette.
  NAcol  color of NA elements.
  lim  The limits of the data; if NULL, the data range will be chosen.

Value

  a vector of character strings giving the colors in hexadecimal format, one for each surface facet.

Note

  This function is inspired by a similar function in package fields, unfortunately made unavailable in most recent version of fields

Author(s)

  Karline Soetaert <karline.soetaert@nioz.nl>

  persp

Examples

  persp(volcano, theta = 135, phi = 30, col = drapecol(volcano),
        main = "drapecol")
  persp(volcano, theta = 135, phi = 30, col = drapecol(volcano),
        border = NA, main = "drapecol")

emptyplot  open a plot without axes, labels,...

Description

  Creates a plotting region, bounded by xlim and ylim; without axes, labels, titles, useful for plotting shapes.

Usage

  emptyplot(xlim = c(0, 1), ylim = xlim, asp = 1, frame.plot = FALSE,
             col = NULL, ...)

Arguments

- **xlim**: the x limits (min,max) of the plot.
- **ylim**: the y limits (min,max) of the plot.
- **asp**: the y/x aspect ratio.
- **frame.plot**: to toggle off drawing of a bounding box.
- **col**: the background color.
- ... arguments passed to R-function plot.

Author(s)

Karline Soetaert <karline.soetaert@nioz.nl>

See Also

- *plot*, *plot.default*

Description

Creates a vector of (n) contiguous colors (darkblue-blue-cyan-yellow-red-darkred).

Usage

femmecol(n = 100)

Arguments

- **n**: number of colors.

Value

- a vector of character strings giving the colors in hexadecimal format

Author(s)

Karline Soetaert <karline.soetaert@nioz.nl>

See Also

- *rainbow*, *heat.colors*, *topo.colors*, the comparable R-functions.
- *intpalette*, *shadepalette*
filledcircle

**Examples**

```r
filled.contour(volcano, color = femmecol, asp = 1, main = "femmecol")
femmecol(10)
image(matrix(nrow = 1, ncol = 100, data = 1:100),
       col = femmecol(100), main = "femmecol")
```

**filledcircle**  
adds colored circle to a plot

**Description**

plots (part of) outer and inner circle and colors inbetween; color can be a palette.

**Usage**

```r
filledcircle(r1 = 1, r2 = 0, mid = c(0,0), dr = 0.01, from = -pi, to = pi,
             col = femmecol(100), values = NULL, zlim = NULL, lwd = 2, lcol = NA, ...)
```

**Arguments**

- `r1`: radius of outer circle.
- `r2`: radius of inner circle.
- `mid`: midpoint of circle.
- `dr`: size of segments, in radians, to draw circle (decrease for smoother).
- `from`: starting angle for circle segment, radians.
- `to`: final angle for circle segment, radians. The segment is drawn counterclockwise. The default is to draw a full circle.
- `col`: color palette to be used; also allowed are two extremes or one value.
- `values`: if not NULL, a matrix providing (radius,z-values) couples, used for coloring.
- `zlim`: Only if values is not NULL: the minimum and maximum z values for which colors should be plotted, defaulting to the range of the finite values of the second column of values.
- `lwd`: width of external line.
- `lcol`: line color.
- `...`: arguments passed to R-function `polygon`.

**Details**

see `filledellipse` for details

**Value**

returns, as invisible a list containing "xyouter" and "xyinner", the points that define the outer and inner ellipse.
filledcylinder

adds a colored and rotated cylinder to a plot

Description

adds a rotated and colored cylinder to a plot; color can be a palette

Usage

filledcylinder(rx = 1, ry = rx, len = 1, col = femmecol(100),
    lcol = NA, lwd = 2, lcolint = NULL, ltyint = 1,
    lwdint = lwd, mid = c(0,0), angle = 0, delt = 1,
    dr = 0.01, topcol = NULL, botcol = NULL, ...)

Arguments

  rx            horizontal radius.
  ry            vertical radius.
  len           length.
filledcylinder

col  color palette to be used; also allowed are two extremes or one value.

lcol  line color on external surface.

lwd  only if lcol!=NA, width of external line.

lcolint  only if lcol!=NA, line color on internal (hidden) surface.

ltyint  only if lcol!=NA, line type on internal (hidden) surface.

lwdint  only if lcol!=NA, line width on internal (hidden) surface.

mid  midpoint of cylinder.

angle  rotation angle, degrees.

delt  increase factor, from left to right.

dr  size of segments, in radians, to draw top/bottom ellipse (decrease for smoother).

topcol  color (palette) of top (right) surface.

botcol  color (palette) of bottom (left) surface.

... arguments passed to function filledellipse.

Details

When angle = 0 (the default), the cylinder is parallel to the x-axis

rx and ry are the horizontal and vertical radiusses of the bordering ellipses. Here "horizontal" and
"vertical" denote the position BEFORE rotation

if delt > 1, the width of the cylinder will increase from left to right.

Examples

emptyplot(c(-1.2, 1.2), c(-1, 1), main = "filledcylinder")
col <- c(rev(greycol(n = 50)), greycol(n = 50))
col2 <- shadepalette("red", "blue", n = 50)
col3 <- shadepalette("yellow", "black", n = 50)
filledcylinder(rx = 0., ry = 0.2, len = 0.25, angle = 0, col = col,
            mid = c(-1, 0), topcol = col[25])
filledcylinder(rx = 0., ry = 0.2, len = 0.25, angle = 0, col = col2,
            mid = c(-1, 0), topcol = col[25])
filledcylinder(rx = 0.1, ry = 0.2, angle = 90, col = col2,
            mid = c(-0.5, 0), topcol = col2[25])
filledcylinder(rx = 0.1, ry = 0.2, angle = 90, col = c(col2, rev(col2)),
            mid = c(0.45, 0), topcol = col2[25])
filledcylinder(rx = 0.05, ry = 0.2, angle = 90, col = c(col3, rev(col3)),
            mid = c(0.9, 0), topcol = col3[25])
filledcylinder(rx = 0.1, ry = 0.2, angle = 90, col = "white",
            lcol = "black", lcolint = "grey")
filledellipse

adds a colored and rotated ellipse to a plot

Description
plots (part of) outer and inner ellipses and colors inbetween; color can be a palette

Usage
filledellipse(rx1 = 1, rx2 = 0, ry1 = rx1, ry2 = NULL, mid = c(0,0),
  dr = 0.01, angle = 0, from = -pi, to = pi, col = femmecol(100),
  values = NULL, zlim = NULL, lwd = 2, lcol = NA, ...)

Arguments
rx1 horizontal radius of outer ellipse.
r2 horizontal radius of inner ellipse.
ry1 vertical radius of outer ellipse.
ry2 vertical radius of inner ellipse.
mid midpoint of ellipse.
dr size of segments, in radians, to draw ellipse (decrease for smoother).
angle rotation angle, degrees.
from starting angle for ellipse segment, radians.
to final angle for ellipse segment, radians. The segment is drawn counterclockwise. The default is draw a full ellipse.
col color palette to be used; also allowed are two extremes or one value.
values if not NULL, a matrix providing (radius,z-values) couples, used for coloring.
zlim Only if values is not NULL: the minimum and maximum z values for which colors should be plotted, defaulting to the range of the finite values of the second column of values.
lwd width of external line.
lcol line color.
... arguments passed to R-function polygon.
Details

draws (part of) an outer and inner ellipse, as specified by inner and outer radiusses:

\texttt{rx1, ry1}: horizontal and vertical radiusses of outer ellipse; \texttt{rx2, ry2}: same for inner ellipse. Here "horizontal" and "vertical" denote the position BEFORE rotation.

Fills with a palette of colors inbetween values: if not \texttt{NULL}, a matrix providing (radius, z-values) couples, used for coloring. Here radius are positive values denoting the relative distance between the shapes centre and edge. The radiusses are rescaled to be in [0,1] if needed. z-values (2nd column of values) together with \texttt{zlim} and \texttt{col} denote the coloration level.

Colors in \texttt{col} will be interpolated to the z-values and used to color an interval as given by the input radiusses.

If \texttt{rx2}, the radius of the inner ellipse is 0, the ellipse is full.

Value

returns, as invisible a list containing "xyouter" and "xyinner", the points that define the outer and inner ellipse.

filledmultigonal  
adds a colored and rotated multigonal shape to a plot

Description

draws and colors a rotated shape with equal-sized vertices; color can be a palette.

Usage

filledmultigonal(mid = c(0, 0), rx = 1, ry = rx, nr = 4, 
col = femmecol(100), values = NULL, 
zlim = NULL, lwd = 2, lcol = NA, angle = 0, ...)

Arguments

mid  
midpoint of multigonal.
rx  
horizontal radius.
ry  
vertical radius.
rn  
number of sides.
col  
color palette to be used; also allowed are two extremes or one value.
values  
if not NULL, a matrix providing (radius,z-values) couples, used for coloring.
zlim  
Only if values is not NULL: the minimum and maximum z values for which 
colors should be plotted, defaulting to the range of the finite values of the second 
column of values.
lwd  
width of external line.
lcol  
line color.
angle  
angle of rotation, in degrees.
...  
arguments passed to R-function polygon.

Details

Coloration proceeds from midpoint to external edge
rx,ry: horizontal and vertical radiusses of the shape. Here "horizontal" and "vertical" denote the position BEFORE rotation
values: if not NULL, a matrix providing (radius,z-values) couples, used for coloring. Here radius 
are positive values denoting the relative distance between the shapes centre and edge. The radiusses 
are rescaled to be in [0,1] if needed. z-values (2nd column of values) together with zlim and col 
denote the coloration level.
Colors in col will be interpolated to the z-values and used to color an interval as given by the input 
radiusses.
Value

returns, as invisible a list containing "xyouter" and "xyinner", the points that define the outer and inner ellipse.

filledrectangle adds a colored and rotated rectangle to a plot

Description
plots and colors a rotated rectangle; color can be a palette

Usage
filledrectangle(mid = c(0, 0), wx = 1, wy = wx, col = femmecol(100),
values = NULL, zlim = NULL, lwd = 2, lcol = NA,
angle = 0, ...)

Arguments
mid midpoint of rectangle.
wx horizontal width.
wy vertical width.
col color palette to be used; also allowed are two extremes or one value.
values if not NULL, a matrix providing (radius,z-values) couples, used for coloring.
zlim Only if values is not NULL: the minimum and maximum z values for which
colors should be plotted, defaulting to the range of the finite values of the second
column of values.
lwd width of external line.
lcol line color.
angle angle of rotation, in degrees.
... arguments passed to R-function polygon.

Details
If angle=0, coloration starts from top to bottom. This is different from filledmultigonal, where
coloration proceeds from middle to external
wx,wy: horizontal and vertical width of the shape Here "horizontal" and "vertical" denote the posi-
tion BEFORE rotation
values: if not NULL, a matrix providing (radius,z-values) couples, used for coloring. Here radius
are positive values denoting the relative distance between the shapes centre and edge. The radiusses
are rescaled to be in [0,1] if needed. z-values (2nd column of values) together with zlim and col
denote the coloration level.
Colors in col will be interpolated to the z-values and used to color an interval as given by the input
radiusses.

---

filledshape

adds a colored shape to a plot

Description

plots outer and inner shape and colors inbetween; color can be a palette

Usage

filledshape(xyouter, xyinner = colMeans(xyouter),
    col = femmecol(100), values = NULL,
    zlim = NULL, lcol = NA, lwd = 2, ...)

Arguments

- xyouter: 2-column matrix with x,y values of outer shape.
- xyinner: 2-column matrix of 2-valued vector with x,y values of inner shape; default is centroid of xyouter.
- col: color palette to be used; also allowed are two extremes.
values if not NULL, a matrix providing (radius,z-values) couples, used for coloring.

zlim Only if values is not NULL: the minimum and maximum z values for which colors should be plotted, defaulting to the range of the finite values of the second column of *values*.

lcol line color.

lwd width of external line, only if lcol != NA.

... arguments passed to R-function polygon

Details
draws and outer and inner shape, as specified in xyouter, and xyinner and fills with a palette of colors inbetween;

values: if not null, a matrix providing (radius,z-values) couples, used for coloring. Here radius are positive values denoting the relative distance between the shapes centre and edge. The radiusses are rescaled to be in [0,1] if needed. z-values (2nd column of values) together with zlim and col denote the coloration level.

Colors in col will be interpolated to the z-values and used to color an interval as given by the input radiusses.

If xyinner is a point, the shape is full.

# abstract art
emptyplot(col = "darkgrey", main = "filledshape")
filledshape(matrix(ncol = 2, runif(100)), col = "darkblue")
```

---

**getellipse** | *x-y coordinates of ellipse*

**Description**
calculates x-y values for (part of) an ellipse; the ellipse can be rotated

**Usage**

```r
getellipse(rx = 1, ry = rx, mid = c(0, 0), dr = 0.01,
  angle = 0, from = -pi, to = pi)
```

**Arguments**

- **rx** long radius of ellipse.
- **ry** short radius of ellipse.
- **mid** midpoint of ellipse.
- **dr** size of segments, in radians, to specify ellipse (decrease for smoother).
- **angle** rotation angle, degrees.
- **from** starting angle for ellipse segment, radians.
- **to** final angle for ellipse segment, radians. The segment is generated counterclockwise. The default is draw a full ellipse.

**Details**

- *rx* and *ry* are the horizontal and vertical radiusses of the ellipses.
- Points from and to are joined counterclockwise. (this has changed since version 1.3.4).

**Value**
a 2-column matrix with x-y values of the ellipse

**Author(s)**

      type = "l", col = "black", lwd = 2)
emptyplot(main = "getellipse")
col <- femmecol(90)
for (i in seq(0, 180, by = 2))
  lines(getellipse(0.5, 0.25, mid = c(0.5, 0.5), angle = i),
        type = "l", col = col[(i/2)+1], lwd = 2)
```

description

**Description**

Creates a vector of (n) contiguous colors from white/grey to black

**Usage**

```r
greycol(n = 100, interval = c(0.0, 0.7))
```

**Arguments**

- `n` number of colors.
- `interval` interval *to* where to interpolate.

**Details**

greycol is an alias of graycol

**Value**

a vector of character strings giving the colors in hexadecimal format.
intpalette

Author(s)
Karline Soetaert <karline.soetaert@nioz.nl>

See Also
rainbow, heat.colors, topo.colors, femmecol

Examples
filled.contour(volcano, color = graycol, asp = 1, main = "greycol,graycol")
graycol(10)
image(matrix(nrow = 1, ncol = 100, data = 1:100),
col = graycol(100), main = "greycol,graycol")

Description
Returns color(s) that are a linear interpolation of a given set of colors.

Usage
intpalette(inputcol, numcol = length(x.to), x.from = NULL, x.to = NULL)

Arguments
inputcol initial colors, *from* where to interpolate.
numcol number of colors to interpolate *to*.
x.from x-values *from* where to interpolate.
x.to x-values where to interpolate *to*.

Details
Return value is a vector of *colors* in hexadecimal format.
This is different from colorRamp (R function), that returns a *function*.

Value
a vector of character strings giving the interpolated colors in hexadecimal format

Author(s)
Karline Soetaert <karline.soetaert@nioz.nl>

See Also
greycol, femmecol, shadepalette, colorRamp for comparable R function
Examples

```r
intpalette(c("white", "black"), n = 10)
grey(seq(1, 0, length.out = 10))
image(matrix(nrow = 1, ncol = 100, data = 1:100),
     col = intpalette(c("red", "blue"), numcol = 100),
     main = "intpalette")
image(matrix(nrow = 1, ncol = 100, data = 1:100),
     col = intpalette(c("red", "blue", "yellow"), numcol = 100),
     main = "intpalette")
```

Description

adds (part of) a colored circle to a plot; an arrow can be drawn at a specified position

Usage

```r
plotcircle(r = 1, ...)
```

Arguments

- `r` radius of circle.
- `...` arguments passed to function `plotellipse`.

Details

`plotcircle` calls `plotellipse`, making sure that the figure drawn effectively looks like a circle. For graphs that have both axes of equal size, the circle will be equal to the ellipse with equal rx and ry. See second example

see `plotellipse` for details

Author(s)

Karline Soetaert <karline.soetaert@nioz.nl>

See Also

`plotellipse` to draw ellipses
**plotellipse**

*Description*

adds (part of) a colored, and rotated ellipse to a plot; an arrow can be drawn at a specified position.

**Usage**

```r
plotellipse(rx = 1, ry = 0.2, mid = c(0,0), dr = 0.01, 
  angle = 0, from = -pi, to = pi, type = "l", lwd = 2, 
  lcol = "black", col = NULL, arrow = FALSE, 
  arr.length = 0.4, arr.width = arr.length*0.5, 
  arr.type = "curved", arr.pos = 1, arr.code = 2, 
  arr.adj = 0.5, arr.col = "black", ...)
```

**Arguments**

- **rx**  
  long radius of ellipse.
- **ry**  
  short radius of ellipse.
- **mid**  
  midpoint of ellipse.
- **dr**  
  size of segments, in radians, to draw ellipse (decrease for smoother).
- **angle**  
  rotation angle, degrees.
- **from**  
  starting angle for ellipse segment, radians.
- **to**  
  final angle for ellipse segment, radians.
- **type**  
  external line or points; "n" if no line.
- **lwd**  
  width of external line.
- **lcol**  
  line color.
col fill color.
arrow drawing arrowhead yes/no.
arr.length length of arrowhead.
arr.width width of arrowhead.
arr.type type of arrow.
arr.pos position of arrow, 0=start,1=end.
arr.code integer code determining kind of arrows to draw.
arr.adj adjustment of arrow.
arr.col color of arrow head.

... arguments passed to R-function lines.

Details

rx and ry are the horizontal and vertical radiusses of the ellipses.
The ellipse is drawn from the point defined by from to the point defined as to which are joined
anti-clockwise.
if arrow is TRUE, an arrow is drawn along the path of the ellipse.
arr.length and arr.width set the size of the arrow.
The type of the arrowhead is set with arr.type which can take the values:

- "simple": uses comparable R function arrows.
- "triangle": uses filled triangle.
- "curved": draws arrowhead with curved edges.
- "circle": draws circular head.

arr.pos, a real value between 0 and 1 gives the position (0=start,1=end).
arr.col specifies the color, arr.code specifies where the angle points to.
arr.adj specifies the position adjustment - see Arrows for details.

plotellipse(rx = 1.0, ry = 0.6, angle = 0, from = pi, to = 2*pi,
   arrow = TRUE, arr.pos = seq(0.1, 0.5, by = 0.1),
   arr.col = rainbow(5))
plotellipse(rx = 1.0, ry = 0.6, angle = 30, from = pi, to = 1.2*pi,
rotatexy

rotatexy

rotates 2-column matrix around a midpoint

Description

rotates xy values around a midpoint; xy is either a 2-columned matrix or a 2-valued vector

Usage

rotatexy(xy, angle, mid = colMeans(xy), asp = FALSE)

Arguments

xy matrix with 2 columns, or a 2-valued vector to be rotated.
angle angle of rotation, in degrees.
mid rotation point, default=centroid.
asp if true: aspect ratio is kept.

Value

a 2-column matrix with rotated values

Author(s)

Karline Soetaert <karline.soetaert@nioz.nl>

Examples

x <- seq(0, 2*pi, pi/100)
y <- sin(x)
cols <- intpalette(c("blue", "green", "yellow", "red"), n = 500)
cols <- c(cols, rev(cols))
plot(x, y, type = "l", ylim = c(-3, 3), main = "rotatexy",
     col = cols[1], lwd = 2)
for (i in 2:1000)
  lines(rotatexy(cbind(x, y), angle = 0.18*i),
        col = cols[i], lwd = 2)

cols <- femmecol(1000)
plot(x, y, xlim = c(-1, 1), ylim = c(-1, 1), main = "rotatexy",
     col = cols[1], type = "n")
for (i in 2:1000) {

plotellipse(rx = 0.1, ry = 0.6, from = 1.5*pi, to = pi,
            lcol = "orange", mid = c(0.2,0.2))
plotellipse(rx = 0.1, ry = 0.6, angle = 30, from = 1.5*pi, to = pi,
            lcol = "orange", mid = c(0.2,0.2))
roundrect  

adds a rounded rectangular box to a plot

Description

adds a rectangular box with rounded left and right edges to a plot

Usage

roundrect(mid, radx, rady, rx = rady, dr = 0.01,  
col = "white", lcol = "black", lwd = 2, angle = 0, ...)

Arguments

mid    midpoint (x,y) of the box.
radx   horizontal radius of the box.
rady   vertical radius of the box.
rx      radius of rounded part.
dr      size of segments, in radians, to draw the rounded line (decrease for smoother).
col    fill color of the box.
lcol   line color surrounding box.
lwd    line width of line surrounding the box.
angle  rotation angle, degrees.
...    arguments passed to function filledshape.

Details

radx and rady are the horizontal and vertical radiusses of the box; rx is the horizontal radius of the rounded part.

Here horizontal and vertical denote the position BEFORE rotation.

Author(s)

Karline Soetaert <karline.soetaert@nioz.nl>

Examples

eemptyplot(c(-0.1, 1.1), main = "roundrect")
for (i in 1:10)  
  roundrect(mid = runif(2), col = i, radx = 0.1, rady = 0.05)
for (i in 1:5)  
  roundrect(mid = runif(2), col = greycol(20), radx = 0.05,  
    rady = 0.05, angle = runif(1)*360)
Description

Returns color(s) that are a linear interpolation between two colors
these colors are suitable for shading shapes

Usage

```
shadepalette(n = 100, endcol = "red", inicol = "white",
interval = c(0.0, 1.0))
```

Arguments

- `n`  number of colors.
- `endcol`  final color.
- `inicol`  initial color.
- `interval`  interval *to* where to interpolate.

Value

a vector of character strings giving the interpolated colors in hexadecimal format

Author(s)

Karline Soetaert <karline.soetaert@nioz.nl>

See Also

`intpalette`, `grey`, `femmecol colorRamp` for comparable R functions.

Examples

```
shadepalette(n = 10, "white", "black")
image(matrix(nrow = 1, ncol = 100, data = 1:100),
    col = shadepalette(100, "red", "blue"), main = "shadepalette")
```
textflag

adds a filled rounded rectangular box with a text to a plot

Description

adds a rectangular box with rounded left and right edges to a plot

Usage

textflag(mid, radx, rady, rx = rady, dr = 0.01,
col = femmecol(100), lcol = "white",
bcol = lcol, lwd = 2, angle = 0, lab = NULL,
leftright = TRUE, tcol = NULL, ...)

Arguments

mid midpoint (x,y) of the box.
radx horizontal radius of the box.
rady vertical radius of the box.
rx radius of rounded part.
dr size of segments, in radians, to draw the rounded line (decrease for smoother).
col fill color of the box; the box will be filled from left to right.
lcol line color surrounding box.
bcol line color to remove the ellipse from the rectangular box.
tcol text color.
lwd line width of line surrounding the box.
angle rotation angle, degrees.
lab one label or a vector string of labels to be added in box.
leftright if TRUE then coloring is from left to right else the coloring is from bottom to top box (for angle = 0).
... other arguments passed to function text.

Details

radx and rady are the horizontal and vertical radiiusses of the box; rx is the horizontal radius of the rounded part.

Here horizontal and vertical denote the position BEFORE rotation.

This function is similar to function roundrect, except that coloring is from left to right.

writelabel

Examples

emptyplot()
textflag(mid = c(0.5, 0.5), radx = 0.5, rady = 0.1,
   lcol = "white", lab = "hello", cex = 5, font = 2:3)
textflag(mid = c(0.5, 0.15), radx = 0.5, rady = 0.1,
   rx = 0.3,lcol = "black", lab = "hello 2", cex = 4,
   font = 2, angle = 20, tcol = "darkblue")
textflag(mid = c(0.5, 0.85), radx = 0.5, rady = 0.1, rx = 0.03,
   lcol = "white", lab = "hello 3", cex = 4, font = 2,
   leftright = FALSE)

writelabel adds a label next to a plot

Description

adds one-character label on left-upper margin, next to a plot

Usage

writelabel(text = NULL, nr = 1, at = -0.1, line = 1, cex = 1.5, ...)

Arguments

text text to write.
nr integer; if text = NULL: nr is converted to uppercase letter.
at relative distance of label position, from left margin of plot region.
line line above the plot region of label position.
cex relative size of label.
... arguments passed to R-function mtext.
