Package ‘soilDB’

October 18, 2022

Type Package
Title Soil Database Interface
Version 2.7.5
Author Dylan Beaudette [aut],
Jay Skovlin [aut],
Stephen Roecker [aut].
Andrew Brown [aut, cre]
Maintainer Andrew Brown <andrew.g.brown@usda.gov>
Description A collection of functions for reading data from USDA-NCSS soil databases.
License GPL (>= 3)
LazyLoad yes
Depends R (>= 3.5.0)
Imports grDevices, graphics, stats, utils, methods, aqp, data.table,
DBI, curl
Suggests jsonlite, httr, xml2, rvest, sf, wk, terra, raster, odbc,
RSQLite, testthat, scales
Repository CRAN

soilDB-package  

**Soil Database Interface**

**Description**

A collection of functions for reading data from USDA-NCSS soil databases.

**Details**

This package provides methods for extracting soils information from local PedonPC and AKSite databases (MS Access format), local NASIS databases (MS SQL Server), Soil Data Access and various other soil-related web services.

**Author(s)**

*seealso* fetchPedonPC, fetchNASIS, SDA_query, loafercreek

---

**createSSURGO**  

Create a SQLite database or GeoPackage from one or more SSURGO Exports

**Description**

Create a SQLite database or GeoPackage from one or more SSURGO Exports

**Usage**

```r
createSSURGO(
  filename,  
exdir,  
pattern = NULL,  
include_spatial = TRUE,  
overwrite = FALSE,  
header = FALSE,  
quiet = TRUE,  
...
)
```
createStaticNASIS

Create a memory or file-based instance of NASIS database

Description

Create a memory or file-based instance of NASIS database for selected tables.

Usage

createStaticNASIS(
  tables = NULL,
  new_names = NULL,
  SS = TRUE,
  dsn = NULL,
  output_path = NULL,
  verbose = FALSE
)

Arguments

- **filename**: Output file name (e.g. 'db.sqlite' or 'db.gpkg')
- **exdir**: Path containing containing SSURGO spatial (.shp) and tabular (.txt) files.
- **pattern**: Character. Optional regular expression to use to filter subdirectories of exdir. Default: NULL will search all subdirectories for SSURGO export files.
- **include_spatial**: Logical. Include spatial data layers in database? Default: TRUE.
- **overwrite**: Logical. Overwrite existing layers? Default FALSE will append to existing tables/layers.
- **header**: Logical. Passed to read.delim() for reading pipe-delimited () text files containing tabular data.
- **quiet**: Logical. Suppress messages and other output from database read/write operations?
- ... Additional arguments passed to write_sf() for writing spatial layers.

Value

Character. Vector of layer/table names in filename.

Examples

```r
# Not run:
downloadSSURGO("areasymbol IN ('CA067', 'CA077', 'CA632')", destdir = "SSURGO_test")
createSSURGO("test.gpkg", "SSURGO_test")
```

---

createStaticNASIS  Create a memory or file-based instance of NASIS database

Description

Create a memory or file-based instance of NASIS database for selected tables.

Usage

createStaticNASIS(
  tables = NULL,
  new_names = NULL,
  SS = TRUE,
  dsn = NULL,
  output_path = NULL,
  verbose = FALSE
)
Arguments

- **tables**: Character vector of target tables. Default: NULL is whatever tables are listed by `DBI::dbListTables` for the connection type being used.

- **new_names**: Optional: new table names (should match length of vector of matching tables in `dsn`).

- **SS**: Logical. Include "selected set" tables (ending with suffix "_View_1"). Default: TRUE

- **dsn**: Optional: path to SQLite database containing NASIS table structure; or a `DBI::dbConnect` object. Default: NULL

- **output_path**: Optional: path to new/existing SQLite database to write tables to. Default: NULL returns table results as named list.

- **verbose**: Show error messages from attempts to dump individual tables? Default FALSE

Value

A named list of results from calling `dbQueryNASIS` for all columns in each NASIS table.

dbConnectNASIS

---

**Create local NASIS database connection**

Description

Create a connection to a local NASIS database with DBI

Usage

```r
dbConnectNASIS(dsn = NULL)
NASIS(dsn = NULL)
```

Arguments

- **dsn**: Optional: path to SQLite database containing NASIS table structure; Default: NULL

Value

A DBI::dbConnect object, as returned by `DBI::dbConnect()`. If `dsn` is a DBIConnection, the attribute `isUserDefined` of the result is set to TRUE. If the `DBI::dbConnect` is created by the internal NASIS connection process, `isUserDefined` is set to FALSE.
**dbQueryNASIS**

*Query a NASIS DBIConnection*

**Description**

Send queries to a NASIS DBIConnection

**Usage**

```r
dbQueryNASIS(conn, q, close = TRUE, ...)
```

**Arguments**

- **conn**: A DBIConnection object, as returned by DBI::dbConnect().
- **q**: A statement to execute using DBI::dbGetQuery; or a (named) vector containing multiple statements to evaluate separately
- **close**: Close connection after query? Default: TRUE
- **...**: Additional arguments to DBI::dbGetQuery

**Value**

Result of DBI::dbGetQuery

---

**downloadSSURGO**

*Get SSURGO ZIP files from Web Soil Survey 'Download Soils Data'*

**Description**

Download ZIP files containing spatial (ESRI shapefile) and tabular (TXT) files with standard SSURGO format; optionally including the corresponding SSURGO Template Database with include_template=TRUE.

**Usage**

```r
downloadSSURGO(
  WHERE = NULL,
  areasymbols = NULL,
  destdir = tempdir(),
  exdir = destdir,
  include_template = FALSE,
  extract = TRUE,
  remove_zip = FALSE,
  overwrite = FALSE,
  quiet = FALSE
)
```
downloadSSURGO

Arguments

WHERE  A SQL WHERE clause expression used to filter records in sacatalog table. Alternately WHERE can be any spatial object supported by SDA_spatialQuery() for defining the target extent.

areasyncs  Character vector of soil survey area symbols e.g. c("CA067", "CA077"). Used in lieu of WHERE argument.

destdir  Directory to download ZIP files into. Default tempdir().

exdir  Directory to extract ZIP archives into. May be a directory that does not yet exist. Each ZIP file will extract to a folder labeled with areasync in this directory. Default: destdir

include_template  Include the (possibly state-specific) MS Access template database? Default: FALSE

extract  Logical. Extract ZIP files to exdir? Default: TRUE

remove_zip  Logical. Remove ZIP files after extracting? Default: FALSE

overwrite  Logical. Overwrite by re-extracting if directory already exists? Default: FALSE

quiet  Logical. Passed to curl::curl_download().

Details

To specify the Soil Survey Areas you would like to obtain data you use a WHERE clause for query of sacatalog table such as areasync = 'CA067', "areasync IN ('CA628', 'CA067')" or areasync LIKE 'CT%'.

Pipe-delimited TXT files are found in /tabular/ folder extracted from a SSURGO ZIP. The files are named for tables in the SSURGO schema. There is no header / the files do not have column names. See the Soil Data Access Tables and Columns Report: https://sdmdataaccess.nrcs.usda.gov/documents/TablesAndColumnsReport.pdf for details on tables, column names and metadata including the default sequence of columns used in TXT files. The function returns a try-error if the WHERE/areasync arguments result in

Several ESRI shapefiles are found in the /spatial/ folder extracted from a SSURGO ZIP. These have prefix soilmu_ (mapunit), soilsa_ (survey area), soilsf_ (special features). There will also be a TXT file with prefix soilsf_ describing any special features. Shapefile names then have an a_ (polygon), l_ (line), p_ (point) followed by the soil survey area symbol.

Value

Character. Paths to downloaded ZIP files (invisibly). May not exist if remove_zip = TRUE.
**estimateColorMixture**

*Estimate color mixtures using weighted average of CIELAB color coordinates*

**Description**

Estimate color mixtures using weighted average of CIELAB color coordinates

**Usage**

\[
\text{estimateColorMixture}(x, \text{wt} = \text{"pct"}, \text{backTransform} = \text{FALSE})
\]

**Arguments**

- **x**: data.frame, typically from NASIS containing at least CIE LAB (‘L’, ‘A’, ‘B’) and some kind of weight
- **wt**: fractional weights, usually area of hz face
- **backTransform**: logical, should the mixed sRGB representation of soil color be transformed to closest Munsell chips? This is performed by aqp::rgb2Munsell default: FALSE

**Value**

A data.frame containing estimated color mixture

**Note**

See [mixMunsell](#) for a more realistic (but slower) simulation of subtractive mixing of pigments.

**Author(s)**

D.E. Beaudette

---

**estimateSTR**

*Estimate Soil Temperature Regime*

**Description**

Estimate soil temperature regime (STR) based on mean annual soil temperature (MAST), mean summer temperature (MSST), mean winter soil temperature (MWST), presence of O horizons, saturated conditions, and presence of permafrost. Several assumptions are made when O horizon or saturation are undefined.
Usage

```r
estimateSTR(
  mast,
  mean.summer,
  mean.winter,
  O.hz = NA,
  saturated = NA,
  permafrost = FALSE
)
```

Arguments

- `mast` vector of mean annual soil temperature (deg C)
- `mean.summer` vector of mean summer soil temperature (deg C)
- `mean.winter` vector of mean winter soil temperature (deg C)
- `O.hz` logical vector of O horizon presence / absence
- `saturated` logical vector of seasonal saturation
- `permafrost` logical vector of permafrost presence / absence

Details

Soil Temperature Regime Evaluation Tutorial

Value

Vector of soil temperature regimes.

Author(s)

D.E. Beaudette

References

See Also

- `STRplot`

Examples

```r
# simple example
estimateSTR(mast=17, mean.summer = 22, mean.winter = 12)
```
fetchKSSL

Get Kellogg Soil Survey Laboratory Data from SoilWeb snapshot

Description

Download soil characterization and morphologic data via BBOX, MLRA, or soil series name query, from the KSSL database.

Usage

```r
fetchKSSL(
  series = NA,
  bbox = NA,
  mlra = NA,
  pedlabsampnum = NA,
  pedon_id = NA,
  pedon_key = NA,
  returnMorphologicData = FALSE,
  returnGeochemicalData = FALSE,
  simplifyColors = FALSE,
  progress = TRUE
)
```

Arguments

- `series`: vector of soil series names, case insensitive
- `bbox`: a single bounding box in WGS84 geographic coordinates e.g. `c(-120, 37, -122, 38)`
- `mlra`: vector of MLRA IDs, e.g. "18" or "22A"
- `pedlabsampnum`: vector of KSSL pedon lab sample number
- `pedon_id`: vector of user pedon ID
- `pedon_key`: vector of KSSL internal pedon ID
- `returnMorphologicData`: logical, optionally request basic morphologic data, see details section
- `returnGeochemicalData`: logical, optionally request geochemical, optical and XRD/thermal data, see details section
- `simplifyColors`: logical, simplify colors (from morphologic data) and join with horizon data
- `progress`: logical, optionally give progress when iterating over multiple requests
Details

This is an experimental interface to a subset for the most commonly used data from a snapshot of KSSL (lab characterization) and NASIS (morphologic) data.

Series-queries are case insensitive. Series name is based on the "correlated as" field (from KSSL snapshot) when present. The "sampled as" classification was promoted to "correlated as" if the "correlated as" classification was missing.

When `returnMorphologicData` is TRUE, the resulting object is a list. The standard output from `fetchKSSL` (SoilProfileCollection object) is stored in the named element "SPC". The additional elements are basic morphologic data: soil color, rock fragment volume, pores, structure, and redoximorph features. There is a 1:many relationship between the horizon data in "SPC" and the additional dataframes in `morph`. See examples for ideas on how to "flatten" these tables.

When `returnGeochemicalData` is TRUE, the resulting object is a list. The standard output from `fetchKSSL` (SoilProfileCollection object) is stored in the named element "SPC". The additional elements are geochemical and mineralogy analysis tables, specifically: geochemical/elemental analyses "geochem", optical mineralogy "optical", and X-ray diffraction / thermal "xrd_thermal". `returnGeochemicalData` will include additional dataframes geochem, optical, and xrd_thermal in list result.

Setting `simplifyColors=TRUE` will automatically flatten the soil color data and join to horizon level attributes.

Function arguments (series, mlra, etc.) are fully vectorized except for bbox.

Value

a SoilProfileCollection object when `returnMorphologicData` is FALSE, otherwise a list.

Note

SoilWeb maintains a snapshot of these KSSL and NASIS data. The SoilWeb snapshot was developed using methods described here: https://github.com/dylanbeaudette/process-kssl-snapshot. Please use the link below for the live data.

Examples

```r
if(requireNamespace("curl") &&
  curl::has_internet()) {

  library(aqp)

  # search by series name
  s <- fetchKSSL(series='auburn')

  # search by bounding-box
  # s <- fetchKSSL(bbox=c(-120, 37, -122, 38))

  # how many pedons
  length(s)

  # plot
  plotSPC(s, name='hzn_desgn', max.depth=150)

  ## morphologic data
  ##

  # get lab and morphologic data
  s <- fetchKSSL(series='auburn', returnMorphologicData = TRUE)

  # extract SPC
  pedons <- s$SPC

  # if (requireNamespace("farver")) {
  #   ## automatically simplify color data (requires farver)
  #   s <- fetchKSSL(series='auburn', returnMorphologicData = TRUE, simplifyColors=TRUE)
  #   # check
  #   par(mar=c(0,0,0,0))
  #   plot(pedons, color='moist_soil_color', print.id=FALSE)
  # }
}
```

**fetchLDM**

Query data from Kellogg Soil Survey Laboratory Data Mart via Soil Data Access or local SQLite snapshot

**Description**

fetchLDM

fetchLDM(
  x = NULL,
  what = "pedlabsampnum",
  bycol = "pedon_key",
  tables = c("lab_physical_properties", "lab_chemical_properties",
             "lab_calculations_including_estimates_and_default_values", "lab_rosetta_Key"),
  chunk.size = 1000,
  ntries = 3,
  layer_type = c("horizon", "layer", "reporting layer"),
  prep_code = c("S", ""),
  analyzed_size_frac = c("<2 mm", ""),
  dsn = NULL
)

Arguments

x
A vector of values to find in column specified by what, default NULL uses no constraints on what

what
A single column name from tables: lab_combine_nasis_ncss, lab_webmap, lab_site, lab_pedon or lab_area

bycol
A single column name from lab_layer used for processing chunks; default: "pedon_key"

tables
A vector of table names; Default is "lab_physical_properties", "lab_chemical_properties", "lab_calculations_including_estimates_and_default_values", and "lab_rosetta_Key". May also include one or more of: "lab_mir", "lab_mineralogy_glass_count", "lab_major_and_trace_elements_and_oxides", "lab_xray_and_thermal" but it will be necessary to select appropriate prep_code and analyzed_size_frac for your analysis (see Details).

chunk.size
Number of pedons per chunk (for queries that may exceed maxJsonLength)

ntries
Number of tries (times to halve chunk.size) before returning NULL; default 3

layer_type
Default: "horizon", "layer", and "reporting layer"

prep_code
Default: "S" and "". May also include one or more of: "F", "HM", "HM_SK", "GP", "M", "N", or "S"

analyzed_size_frac
Default: "<2 mm" and "". May also include one or more of: "<0.002 mm", "0.02-0.05 mm", "0.05-0.1 mm", "0.1-0.25 mm", "0.25-0.5 mm", "0.5-1 mm", "1-2 mm", "0.02-2 mm", "0.05-2 mm"

dsn
Data source name; either a path to a SQLite database, an open DBIConnection or (default) NULL (to use soilDB::SDA_query)

Details

If the chunk.size parameter is set too large and the Soil Data Access request fails, the algorithm will re-try the query with a smaller (halved) chunk.size argument. This will be attempted up to 3 times before returning NULL.
Currently the `lab_area` tables are joined only for the "Soil Survey Area" related records. When requesting data from "lab_major_and_trace_elements_and_oxides", "lab_mineralogy_glass_count", or "lab_xray_and_thermal" multiple preparation codes (prep_code) or size fractions (analyzed_size_frac) are possible. The default behavior of fetchLDM() is to attempt to return a topologically valid (minimal overlaps) SoilProfileCollection. This is achieved by setting prep_code="S" ("sieved") and analyzed_size_frac="<2 mm". You may specify alternate or additional preparation codes or fractions as needed, but note that this may cause "duplication" of some layers where measurements were made with different preparation or on fractionated samples.

Value

- a SoilProfileCollection for a successful query, a try-error if no site/pedon locations can be found or NULL for an empty lab_layer (within sites/pedons) result

Examples

```r
## Not run:

if(requireNamespace("curl") & curl::has_internet()) {

  # fetch by ssa_key
  res <- fetchLDM(8297, what = "ssa_key")

  # physical properties correlated as taxonomic subgroup "Typic Argialbolls"
  res <- fetchLDM(x = "Typic Argialbolls", what = "corr_taxsubgrp",
                   tables = "lab_physical_properties")

  # fetch by area_code (SSA only)
  res <- fetchLDM("CA630", what = "area_code")
}

## End(Not run)
```

Description

Fetch commonly used site/pedon/horizon data or component from NASIS, returned as a SoilProfileCollection object.

Usage

```r
fetchNASIS(
  from = "pedons",
  url = NULL,
  ```
SS = TRUE,
rmHzErrors = FALSE,
nullFragsAreZero = TRUE,
soilColorState = "moist",
mixColors = TRUE,
lab = FALSE,
fill = FALSE,
dropAdditional = TRUE,
dropNonRepresentative = TRUE,
duplicates = FALSE,
stringsAsFactors = NULL,
dsn = NULL
)

get_RMF_from_NASIS_db(SS = TRUE, dsn = NULL)

get_concentrations_from_NASIS_db(
  SS = TRUE,
  stringsAsFactors = NULL,
  dsn = NULL
)

get_phfmp_from_NASIS_db(SS = TRUE, stringsAsFactors = NULL, dsn = NULL)

Arguments

from determines what objects should be fetched? ('pedons' | 'components' | 'pedon_report')
url string specifying the url for the NASIS pedon_report (default: NULL)
SS fetch data from the currently loaded selected set in NASIS or from the entire local database (default: TRUE)
rmHzErrors should pedons with horizon depth errors be removed from the results? (default: FALSE)
nullFragsAreZero should fragment volumes of NULL be interpreted as 0? (default: TRUE), see details
soilColorState Used only for from='pedons'; which colors should be used to generate the convenience field soil_color? ('moist' or 'dry')
mixColors should mixed colors be calculated (Default: TRUE) where multiple colors are populated for the same moisture state in a horizon? FALSE takes the dominant color for each horizon moist/dry state.
lab should the phlabresults child table be fetched with site/pedon/horizon data (default: FALSE)
fill include pedon or component records without horizon data in result? (default: FALSE)
dropAdditional Used only for from='components' with duplicates=TRUE. Prevent "duplication" of mustatus="additional" mapunits? Default: TRUE
fetchNASIS

dropNonRepresentative

Used only for from='components' with duplicates=TRUE. Prevent "duplication" of non-representative data mapunits? Default: TRUE

duplicates

Used only for from='components'. Duplicate components for all instances of use (i.e. one for each legend data mapunit is used on; optionally for additional mapunits, and/or non-representative data mapunits?)

stringsAsFactors

deprecated

dsn

Optional: path to local SQLite database containing NASIS table structure; default: NULL

Details

This function imports data from NASIS into R as a SoilProfileCollection object. It "flattens" NASIS pedon and component tables, including their child tables, into several more easily manageable data frames. Primarily these functions access the local NASIS database using an ODBC connection. However using the fetchNASIS() argument from = "pedon_report", data can be read from the NASIS Report 'fetchNASIS', as either a txt file or url. The primary purpose of fetchNASIS(from = "pedon_report") is to facilitate importing datasets larger than 8000+ pedons/components.

The value of nullFragsAreZero will have a significant impact on the rock fragment fractions returned by fetchNASIS. Set nullFragsAreZero = FALSE in those cases where there are many data-gaps and NULL rock fragment values should be interpreted as NULL. Set nullFragsAreZero = TRUE in those cases where NULL rock fragment values should be interpreted as 0.

This function attempts to do most of the boilerplate work when extracting site/pedon/horizon or component data from a local NASIS database. Pedons that are missing horizon data, or have errors in their horizonation are excluded from the returned object, however, their IDs are printed on the console. Pedons with combination horizons (e.g. B/C) are erroneously marked as errors due to the way in which they are stored in NASIS as two overlapping horizon records.

Tutorials:

• fetchNASIS Pedons Tutorial
• fetchNASIS Components Tutorial

Value

A SoilProfileCollection object

Author(s)

D. E. Beaudette, J. M. Skovlin, S.M. Roecker, A.G. Brown

See Also

get_component_data_from_NASIS()
fetchNASISLabData  Get NCSS Pedon laboratory data from NASIS

Description
Fetch KSSL laboratory pedon/horizon layer data from a local NASIS database, return as a SoilProfileCollection object.

Usage
fetchNASISLabData(SS = TRUE, dsn = NULL)

Arguments
SS  fetch data from the currently loaded selected set in NASIS or from the entire local database (default: TRUE)
dsn  Optional: path to local SQLite database containing NASIS table structure; default: NULL

Details
This function currently works only on Windows, and requires a ’nasis_local’ ODBC connection.

Value
a SoilProfileCollection object

Author(s)
J.M. Skovlin and D.E. Beaudette

get_cosoilmoist_from_NASISWebReport(
    projectname,
    impute = TRUE,
    stringsAsFactors = NULL
)

get_sitesoilmoist_from_NASISWebReport(usiteid)

Arguments

- **projectname**: text string vector of project names to be inserted into a SQL WHERE clause (default: NA)
- **rmHzErrors**: should pedons with horizonation errors be removed from the results? (default: FALSE)
- **fill**: should rows with missing component ids be removed (default: FALSE)
- **stringsAsFactors**: deprecated
- **mlraoffice**: text string value identifying the MLRA Regional Soil Survey Office group name inserted into a SQL WHERE clause (default: NA)
- **areasymbol**: text string value identifying the area symbol (e.g. IN001 or IN%) inserted into a SQL WHERE clause (default: NA) NULL (default: TRUE)
- **droplevels**: logical: indicating whether to drop unused levels in classifying factors. This is useful when a class has large number of unused classes, which can waste space in tables and figures.
- **mlrassoarea**: text string value identifying the MLRA Soil Survey Office areasymbol symbol inserted into a SQL WHERE clause (default: NA)
- **fiscalyear**: text string value identifying the fiscal year inserted into a SQL WHERE clause (default: NA)
- **projecttypename**: text string value identifying the project type name inserted into a SQL WHERE clause (default: NA)
- **impute**: replace missing (i.e. NULL) values with "Not_Populated" for categorical data, or the "RV" for numeric data or 201 cm if the "RV" is also NULL (default: TRUE)
- **usiteid**: character: User Site IDs

Value

A data.frame or list with the results.
Author(s)

Stephen Roecker

fetchOSD

Get Official Series Descriptions and summaries from SoilWeb API

Description

This function fetches a variety of data associated with named soil series, extracted from the USDA-NRCS Official Series Description text files and detailed soil survey (SSURGO). These data are periodically updated and made available via SoilWeb.

Usage

fetchOSD(soils, colorState = "moist", extended = FALSE)

Arguments

- **soils**: a character vector of named soil series; case-insensitive
- **colorState**: color state for horizon soil color visualization: "moist" or "dry"
- **extended**: if TRUE additional soil series summary data are returned, see details

Details

- overview of all soil series query functions
- competing soil series
- siblings

The standard set of "site" and "horizon" data are returned as a SoilProfileCollection object (extended=FALSE). The "extended" suite of summary data can be requested by setting extended=TRUE. The resulting object will be a list with the following elements:

- **SPC**: SoilProfileCollection containing standards "site" and "horizon" data
- **competing**: competing soil series from the SC database snapshot
- **geog_assoc_soils**: geographically associated soils, extracted from named section in the OSD
- **geomcomp**: empirical probabilities for geomorphic component, derived from the current SSURGO snapshot
- **hillpos**: empirical probabilities for hillslope position, derived from the current SSURGO snapshot
- **mtnpos**: empirical probabilities for mountain slope position, derived from the current SSURGO snapshot
- **terrace**: empirical probabilities for river terrace position, derived from the current SSURGO snapshot
- **flats**: empirical probabilities for flat landscapes, derived from the current SSURGO snapshot
**shape_across** empirical probabilities for surface shape (across-slope) from the current SSURGO snapshot

**shape_down** empirical probabilities for surface shape (down-slope) from the current SSURGO snapshot

**pmkind** empirical probabilities for parent material kind, derived from the current SSURGO snapshot

**pmorigin** empirical probabilities for parent material origin, derived from the current SSURGO snapshot

**mlra** empirical MLRA membership values, derived from the current SSURGO snapshot

**climate** experimental climate summaries from PRISM stack (CONUS only)

**NCCPI** select quantiles of NCCPI and Irrigated NCCPI, derived from the current SSURGO snapshot

**metadata** metadata associated with SoilWeb cached summaries

When using extended = TRUE, there are a couple of scenarios in which series morphology contained in SPC do not fully match records in the associated series summaries (e.g. competing).

1. **A query for soil series that exist entirely outside of CONUS (e.g. PALAU).** - Climate summaries are empty data.frames because these summaries are currently generated from PRISM. We are working on a solution that uses DAYMET.

2. **A query for data within CONUS, but OSD morphology missing due to parsing error (e.g. formatting, typos).** - Extended summaries are present but morphology missing from SPC. A warning is issued.

These last two cases are problematic for analysis that makes use of morphology and extended data, such as outlined in this tutorial on competing soil series.

**Value**

a SoilProfileCollection object containing basic soil morphology and taxonomic information.

  curl::has_internet()) {

  # soils of interest
  s.list <- c('musick', 'cecil', 'drummer', 'amador', 'pentz',
               'reiff', 'san joaquin', 'montpellier', 'grangeville', 'pollasky', 'ramona')

  # fetch and convert data into an SPC
  s.moist <- fetchOSD(s.list, colorState='moist')
  s.dry <- fetchOSD(s.list, colorState='dry')

  # plot profiles
  # moist soil colors
  if (require("aqp") && requireNamespace("scales")) {
    par(mar=c(0,0,0,0), mfrow=c(2,1))
    plot(s.moist, name='hzname',
         cex.names=0.85, axis.line.offset=-4)
    plot(s.dry, name='hzname',
         cex.names=0.85, axis.line.offset=-4)

    # extended mode: return a list with SPC + summary tables
    x <- fetchOSD(s.list, extended = TRUE, colorState = 'dry')

    par(mar=c(0,0,1,1))
    plot(x$SPC)
    str(x, 1)

    # use makeChunks() for iteration over larger sequences of soil series
    s.list <- c('musick', 'cecil', 'drummer', 'amador', 'pentz',
                'reiff', 'san joaquin', 'montpellier', 'grangeville', 'pollasky', 'ramona')

    # make a vector of chunk IDs, with 2 series / chunk
    ck <- makeChunks(s.list, size = 2)

    # split original data by chunk IDs
    # iterate over resulting list
    # run fetchOSD() on pieces
    # result is a list of SoilProfileCollection objects
    x <- lapply(split(s.list, ck), fetchOSD)

    # flatten into a single SPC
    x <- combine(x)

    # there should be 11 profiles
    length(x)
  }
```
fetchPedonPC

Get a SoilProfileCollection from a PedonPC v.5 database

Description

Fetch commonly used site/horizon data from a version 5.x PedonPC database, return as a SoilProfileCollection object.

Usage

fetchPedonPC(dsn)

getHzErrorsPedonPC(dsn, strict = TRUE)

Arguments

dsn The path to a PedonPC version 6.x database
strict Use "strict" horizon error checking? Default: TRUE

Value

a SoilProfileCollection class object

Note

This function attempts to do most of the boilerplate work when extracting site/horizon data from a PedonPC or local NASIS database. Pedons that have errors in their horizonation are excluded from the returned object, however, their IDs are printed on the console. See getHzErrorsPedonPC for a simple approach to identifying pedons with problematic horizonation. Records from the 'taxhistory' table are selected based on 1) most recent record, or 2) record with the least amount of missing data.

get_hz_data_from_pedon_db
fetchRaCA

Get Rapid Carbon Assessment (RaCA) data

Description

Get Rapid Carbon Assessment (RaCA) data by state, geographic bounding-box, RaCA site ID, or soil series query from the SoilWeb API. This interface to the data was an experimental delivery service that does not include the latest soil carbon measurements.

Please use current RaCA distribution if you need measured SOC.

This interface will be updated sometime calendar year 2022 to include the latest soil morphology, taxonomic classification, and measured SOC values. More detailed coordinates for sample sites should also be available.

See https://www.nrcs.usda.gov/Internet/FSE_MANUSCRIPTS/alabama/raca_download/raca_download.zip for direct download of the full dataset.

Usage

fetchRaCA(
  series = NULL,
  bbox = NULL,
  state = NULL,
  rcasiteid = NULL,
  get.vnir = FALSE
)

Arguments

series a soil series name; case-insensitive
bbox a bounding box in WGS84 geographic coordinates e.g. c(-120, 37, -122, 38), constrained to a 5-degree block
state a two-letter US state abbreviation; case-insensitive
rcasiteid a RaCA site id (e.g. 'C1609C01')
get.vnir logical, should associated VNIR spectra be downloaded? (see details)

Details

The VNIR spectra associated with RaCA data are quite large (each gzip-compressed VNIR spectra record is about 6.6kb), so requests for these data are disabled by default. Note that VNIR spectra can only be queried by soil series or geographic BBOX.

Value

pedons: a SoilProfileCollection object containing site/pedon/horizon data
trees: a data.frame object containing tree DBH and height
veg: a data.frame object containing plant species
stock: a data.frame object containing carbon quantities (stocks) at standardized depths
sample: a data.frame object containing sample-level bulk density and soil organic carbon values
spectra: a numeric matrix containing VNIR reflectance spectra from 350–2500 nm

fetchSCAN

**Get Daily Climate Data from USDA-NRCS SCAN (Soil Climate Analysis Network) Stations**

Description
Query soil/climate data from USDA-NRCS SCAN Stations

Usage
```r
fetchSCAN(
  site.code = NULL,
  year = NULL,
  report = "SCAN",
  timeseries = c("Daily", "Hourly"),
  ...
)
```

SCAN_sensor_metadata(site.code)

SCAN_site_metadata(site.code = NULL)

Arguments
- **site.code** a vector of site codes. If NULL SCAN_site_metadata() returns metadata for all SCAN sites.
- **year** a vector of years
- **report** report name, single value only; default 'SCAN', other example options include individual sensor codes, e.g. 'SMS' for Soil Moisture Storage, 'TEMP' for temperature
timeseries either 'Daily' or 'Hourly'

... additional arguments. May include intervalType, format, sitenum, interval, year, month. Presence of additional arguments bypasses default batching functionality provided in the function and submits a 'raw' request to the API form.

Details

Possible above and below ground sensor types include: 'SMS' (soil moisture), 'STO' (soil temperature), 'SAL' (salinity), 'TAVG' (daily average air temperature), 'TMIN' (daily minimum air temperature), 'TMAX' (daily maximum air temperature), 'PRCP' (daily precipitation), 'PREC' (daily precipitation), 'SNWD' (snow depth), 'WTEQ' (snow water equivalent),'WDIRV' (wind direction), 'WSPDV' (wind speed), 'LRADT' (solar radiation/langley total).

SCAN Sensors:
All Soil Climate Analysis Network (SCAN) sensor measurements are reported hourly.

SNOTEL Sensors:
All Snow Telemetry (SNOTEL) sensor measurements are reported daily.

See the fetchSCAN tutorial for additional usage and visualization examples.
Value

A list of data.frame objects, where each element name is a sensor type, plus a metadata table; different report types change the types of sensor data returned. SCAN_sensor_metadata() and SCAN_site_metadata() return a data.frame. NULL on bad request.

Author(s)

D.E. Beaudette, A.G. Brown

References

See the National Water and Climate Center home page for more information on the SCAN and SNOTEL programs, information on web services, and interactive maps of snow water equivalent, precipitation and streamflow.

Examples

```r
if(requireNamespace("curl") &&
curl::has_internet() &&
requireNamespace("httr") &&
requireNamespace("rvest")) {

  # get data
  x <- try(fetchSCAN(site.code=c(356, 2072), year=c(2015, 2016)))
  str(x)

  # get sensor metadata
  m <- SCAN_sensor_metadata(site.code=c(356, 2072))

  # get site metadata
  m <- SCAN_site_metadata(site.code=c(356, 2072))

  # get hourly data (396315 records)
  # x <- try(fetchSCAN(site.code=c(356, 2072), year=c(2015, 2016), timeseries = "Hourly"))
}
```

fetchSDA_spatial

*Get Spatial Data from Soil Data Access by mukey, nationalmusym or areasymbol*

Description

This method facilitates queries to Soil Data Access (SDA) mapunit and survey area geometry. Queries are generated based on map unit key (mukey) and national map unit symbol (nationalmusym) for mupolygon (SSURGO) or gsmmupolygon (STATSGO) geometry OR legend key (lkey) and area symbols (areasymbol) for sapolygon (Soil Survey Area; SSA) geometry.
fetchSDA_spatial

A Soil Data Access query returns geometry and key identifying information about the map unit or area of interest. Additional columns from the map unit or legend table can be included; see add.fields argument.

Usage

fetchSDA_spatial(
  x,
  by.col = "mukey",
  method = "feature",
  geom.src = "mupolygon",
  db = "SSURGO",
  add.fields = NULL,
  chunk.size = 10,
  verbose = TRUE,
  as_Spatial = getOption("soilDB.return_Spatial", default = FALSE)
)

Arguments

x A vector of map unit keys (mukey) or national map unit symbols (nmusym) for mupolygon geometry OR legend keys (lkey) or soil survey area symbols (areasymbol) for sapolygon geometry
by.col Column name containing map unit identifier "mukey", "nmusym"/"nationalmusym" for geom.src mupolygon OR "areasymbol", "areaname", "mlraoffice", "mouagencyresp" for geom.src sapolygon; default is determined by is.numeric(x) TRUE for mukey or lkey and nationalmusym or areasymbol otherwise.
method geometry result type: "feature" returns polygons, "bbox" returns the bounding box of each polygon (via STEnvelope()), and "point" returns a single point (via STPointOnSurface()) within each polygon.
geom.src Either mupolygon (map unit polygons) or sapolygon (soil survey area boundary polygons)
db Default: "SSURGO". When geom.src is mupolygon, use STATSGO polygon geometry instead of SSURGO by setting db = "STATSGO"
add.fields Column names from mapunit or legend table to add to result. Must specify parent table name as the prefix before column name e.g. mapunit.muname.
chunk.size Number of values of x to process per query. Necessary for large results. Default: 10
verbose Print messages?
as_Spatial Return sp classes? e.g. Spatial*DataFrame. Default: FALSE.

Details

This function automatically "chunks" the input vector (using makeChunks()) of map unit identifiers to minimize the likelihood of exceeding the SDA data request size. The number of chunks varies with the chunk.size setting and the length of your input vector. If you are working with many map units and/or large extents, you may need to decrease this number in order to have more chunks.
Querying regions with complex mapping may require smaller chunk size. Numerically adjacent IDs in the input vector may share common qualities (say, all from same soil survey area or region) which could cause specific chunks to perform "poorly" (slow or error) no matter what the chunk size is. Shuffling the order of the inputs using sample() may help to eliminate problems related to this, depending on how you obtained your set of MUKEY/nationalmusym to query. One could feasibly use muacres as a heuristic to adjust for total acreage within chunks.

Note that STATSGO data are fetched where CLIPAREASYMBOL = 'US' to avoid duplicating state and national subsets of the geometry.

**Value**

an sf data.frame corresponding to SDA spatial data for all symbols requested. If as_Spatial=TRUE returns a Spatial*DataFrame from the sp package via sf::as_Spatial() for backward compatibility. Default result contains geometry with attribute table containing unique feature ID, symbol and area symbol plus additional fields in result specified with add.fields.

**Author(s)**

Andrew G. Brown, Dylan E. Beaudette

**Examples**

```r
if(requireNamespace("curl") &
curl::has_internet()) {
  # get spatial data for a single mukey
  single.mukey <- try(fetchSDA_spatial(x = "2924882"))

  # demonstrate fetching full extent (multi-mukey) of national musym
  full.extent.nmusym <- try(fetchSDA_spatial(x = "2x8l5", by = "nmusym"))

  # compare extent of nmusym to single mukey within it
  if (!inherits(single.mukey, 'try-error') &
    !inherits(full.extent.nmusym, 'try-error')) {
    if (requireNamespace("sf")) {
      plot(sf::st_geometry(full.extent.nmusym), col = "RED", border = 0)
      plot(sf::st_geometry(single.mukey), add = TRUE, col = "BLUE", border = 0)
    }
  }
  # demo adding a field ('muname') to attribute table of result
  head(try(fetchSDA_spatial(x = "2x8l5", by="nmusym", add.fields="muname")))
}
```
fetchSoilGrids

Get SoilGrids 250m properties information from point locations

Description

This function obtains SoilGrids properties information (250m raster resolution) given a data.frame containing site IDs, latitudes and longitudes. SoilGrids API and maps return values as whole (integer) numbers to minimize the storage space used. These values are converted by to produce conventional units by 'fetchSoilGrids()'

Usage

fetchSoilGrids(
  x,
  loc.names = c("id", "lat", "lon"),
  verbose = FALSE,
  progress = FALSE
)

Arguments

x
A data.frame containing 3 columns referring to site ID, latitude and longitude.
loc.names
Optional: Column names referring to site ID, latitude and longitude. Default: c("id", "lat", "lon")
verbose
Print messages? Default: FALSE
progress
logical, give progress when iterating over multiple requests; Default: FALSE

Details

SoilGrids predictions are made for the six standard depth intervals specified in the GlobalSoilMap.
IUSS working group and its specifications. The depth intervals returned are: "0-5cm", "5-15cm", "15-30cm", "30-60cm", "60-100cm", "100-200cm" and the properties returned are "bdod", "cec", "cfvo", "clay", "nitrogen", "phh2o", "sand", "silt", "soc"—each with 5th, 50th, 95th, mean and uncertainty values. The uncertainty values are the ratio between the inter-quantile range (90% prediction interval width) and the median: 

\[
\frac{(Q_{0.95} - Q_{0.05})}{Q_{0.50}}.
\]

Point data requests are made through properties/query endpoint of the SoilGrids v2.0 REST API. Please check ISRIC’s data policy, disclaimer and citation: https://www.isric.org/about/data-policy. Find out more information about the SoilGrids and GlobalSoilMap products here:

- https://www.isric.org/explore/soilgrids/faq-soilgrids

Value

A SoilProfileCollection

dsn = NULL
)

get_vegplot_textnote_from_NASIS_db(
  SS = TRUE,
  fixLineEndings = TRUE,
  stringsAsFactors = NULL,
  dsn = NULL
)

Arguments

SS      fetch data from the currently loaded selected set in NASIS or from the entire local database (default: TRUE)
stringsAsFactors  deprecated
dsn  Optional: path to local SQLite database containing NASIS table structure; default: NULL
fixLineEndings  Replace '\r\n' with '\n'; Default: TRUE

Value

A named list containing: "vegplot", "vegplotlocation", "vegplotrhi", "vegplotspecies", "vegtransect", "vegtransplantsum", 'vegsiteindexsum', 'vegsiteindexdet', and "vegplottext" tables

---

filter_geochem  Filter KSSL Geochemical Table

Description

A function to subset KSSL "geochem" / elemental analysis result table to obtain rows/columns based on: column name, preparation code, major / trace element method.

Usage

filter_geochem(
  geochem,
  columns = NULL,
  prep_code = NULL,
  major_element_method = NULL,
  trace_element_method = NULL
)
Arguments

- `geochem`: geochemical data, as returned by `fetchKSSL`.
- `columns`: Column name(s) to include in result.
- `prep_code`: Character vector of prep code(s) to include in result.
- `major_element_method`: Character vector of major element method(s) to include in result.
- `trace_element_method`: Character vector of trace element method(s) to include in result.

Value

A data.frame, subset according to the constraints specified in arguments.

Author(s)

Andrew G. Brown.

Description

Concatenate a vector to SQL IN-compatible syntax: `letters[1:3]` becomes (`'a', 'b', 'c'`). Values in `x` are first passed through `unique()`.

Usage

`format_SQL_in_statement(x)`

Arguments

- `x`: A character vector.

Value

A character vector (unit length) containing concatenated group syntax for use in SQL IN, with unique value found in `x`.

Note

Only character output is supported.
Examples

library(aqp)

# get some mukeys
q <- "select top(2) mukey from mapunit;"
mukeys <- SDA_query(q)

# format for use in an SQL IN statement
mukey.inst <- format_SQL_in_statement(mukeys$mukey)
mukey.inst

# make a more specific query: for component+horizon data, just for those mukeys
q2 <- sprintf("SELECT * FROM mapunit
   INNER JOIN component ON mapunit.mukey = component.mukey
   INNER JOIN chorizon ON component.cokey = chorizon.cokey
   WHERE mapunit.mukey IN %s;", mukey.inst)

# do the query
res <- SDA_query(q2)

# build a SoilProfileCollection from horizon-level records
depths(res) <- ~ cokey ~ hzdept_r + hzdepb_r

# normalize mapunit/component level attributes to site-level for plot
site(res) <- ~ muname + mukey + compname + comppct_r + taxclname

# make a nice label
res$labelname <- sprintf("%s (%s\%s)\", res$compname, res$comppct_r, ")"

# major components only
res <- subset(res, comppct_r >= 85)

if (requireNamespace("scales")) {
  # inspect plot of result
  par(mar=c(0,0,0,0))
  groupedProfilePlot(res, groups = "mukey", color = "hzname", cex.names=0.8,
                     id.style = "side", label = "labelname")
}

getHzErrorsNASIS

Get Logic Errors in NASIS/PedonPC Pedon Horizon

Description

Get Logic Errors in NASIS/PedonPC Pedon Horizon
Usage

getHzErrorsNASIS(strict = TRUE, SS = TRUE, dsn = NULL)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strict</td>
<td>how strict should horizon boundaries be checked for consistency: TRUE=more</td>
</tr>
<tr>
<td>SS</td>
<td>fetch data from the currently loaded selected set in NASIS or from the entire local database (default: TRUE)</td>
</tr>
<tr>
<td>dsn</td>
<td>Optional: path to local SQLite database containing NASIS table structure; default: NULL</td>
</tr>
</tbody>
</table>

Value

A data.frame containing problematic records with columns: 'peiid', 'pedon_id', 'hzdept', 'hzdepb', 'hzname'

get_colors_from_NASIS_db

Get Soil Color Data from a local NASIS Database

Description

Get, format, mix, and return color data from a NASIS database.

Usage

get_colors_from_NASIS_db(SS = TRUE, mixColors = TRUE, dsn = NULL)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SS</td>
<td>fetch data from Selected Set in NASIS or from the entire local database (default: TRUE)</td>
</tr>
<tr>
<td>mixColors</td>
<td>should mixed colors be calculated (Default: TRUE) where multiple colors are populated for the same moisture state in a horizon? FALSE takes the dominant color based on colorpct or first record based on horizon ID (phiid) sorting for &quot;moist&quot; and &quot;dry&quot; state. Pedon Horizon Color records without a moisture state populated are ignored.</td>
</tr>
<tr>
<td>dsn</td>
<td>Optional: path to local SQLite database containing NASIS table structure; default: NULL</td>
</tr>
</tbody>
</table>

Value

A data.frame with the results.

Author(s)

Jay M. Skovlin and Dylan E. Beaudette
get_colors_from_pedon_db

Get Soil Color Data from a PedonPC Database

Description
Get, format, mix, and return color data from a PedonPC database.

Usage
get_colors_from_pedon_db(dsn)

Arguments
dsn
The path to a 'pedon.mdb' database.

Value
A data.frame with the results.

Author(s)
Dylan E. Beaudette and Jay M. Skovlin

See Also
get_hz_data_from_pedon_db, get_site_data_from_pedon_db

get_comonth_from_NASIS_db

Get component month data from a local NASIS Database

Description
Get component month data from a local NASIS Database.

Usage
get_comonth_from_NASIS_db(
  SS = TRUE,  
  fill = FALSE,  
  stringsAsFactors = NULL,  
  dsn = NULL
)

See Also
get_hz_data_from_NASIS_db, get_site_data_from_NASIS_db
get_component_data_from_NASIS_db

Get component data from a local NASIS Database

Description

Get component data from a local NASIS Database

Arguments

SS  get data from the currently loaded Selected Set in NASIS or from the entire local database (default: TRUE)
fill  should missing "month" rows in the comonth table be filled with NA (FALSE)
stringsAsFactors  deprecated
dsni  Optional: path to local SQLite database containing NASIS table structure; default: NULL

Value

A list with the results.

  SS = TRUE,
  fill = FALSE,
  dsn = NULL,
  nullFragsAreZero = TRUE
)
get_component_data_from_NASIS_db

Arguments

SS fetch data from the currently loaded selected set in NASIS or from the entire local database (default: TRUE)

nullFragsAreZero should surface fragment cover percentages of NULL be interpreted as 0? (default: TRUE)

stringsAsFactors deprecated

dsn Optional: path to local SQLite database containing NASIS table structure; default: NULL

dropAdditional Remove map units with "additional" status? Default: TRUE

dropNotRepresentative Remove non-representative data map units? Default: TRUE

fill Return a single minimal (NA-filled) horizon for components with no horizon records? Default FALSE

Value

a data.frame

  str(fc)
}
get_component_from_GDB

Get a SoilProfileCollection from a SSURGO file geodatabase

Description

Functions to load and flatten commonly used tables and from SSURGO file geodatabases, and create soil profile collection objects (SPC).

Usage

```r
get_component_from_GDB(
  dsn = "gNATSGO_CONUS.gdb",
  WHERE = NULL,
  childs = FALSE,
  droplevels = TRUE,
  stringsAsFactors = NULL
)
```

```r
get_legend_from_GDB(
  dsn = "gNATSGO_CONUS.gdb",
  WHERE = NULL,
  droplevels = TRUE,
  stringsAsFactors = NULL,
  stats = FALSE
)
```

```r
gemapunit_from_GDB(
  dsn = "gNATSGO_CONUS.gdb",
  WHERE = NULL,
  droplevels = TRUE,
  stringsAsFactors = NULL,
  stats = FALSE
)
```

```r
fetchGDB(
  dsn = "gNATSGO_CONUS.gdb",
  WHERE = NULL,
  childs = FALSE,
  droplevels = TRUE,
  stringsAsFactors = NULL
)
```

Arguments

dsn data source name (interpretation varies by driver - for some drivers, dsn is a file name, but may also be a folder, or contain the name and access credentials of
get_component_from_GDB

a database); in case of GeoJSON, dsn may be the character string holding the geojson data. It can also be an open database connection.

WHERE
text string formatted as an SQL WHERE clause (default: FALSE)

childs
logical; if FALSE parent material and geomorphic child tables are not flattened and appended

droplevels
logical: indicating whether to drop unused levels in classifying factors. This is useful when a class has large number of unused classes, which can waste space in tables and figures.

stringsAsFactors
deprecated

stats
Return statistics (number of mapunit keys per legend; number of components, major components per mapunit, total and hydric component percentage)? Default: FALSE

Details

These functions return data from SSURGO file geodatabases with the use of a simple text string that formatted as an SQL WHERE clause (e.g. WHERE = "areasymbol = 'IN001'"). Any columns within the target table can be specified (except for fetchGDB() which currently can only target one table (e.g. legend, mapunit or component) at a time with the WHERE clause).

Value

A data.frame or SoilProfileCollection object.

Author(s)

Stephen Roecker

Examples

```r
## replace `dsn` with path to your own geodatabase (SSURGO OR gNATSGO)
##
## download CONUS gNATSGO from here:
## https://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/survey/geo/?cid=nrcseprd1464625
##
##
## dsn <- "D:/geodata/soils/gNATSGO_CONUS.gdb"
##
## le <- get_legend_from_GDB(dsn = dsn, WHERE = "areasymbol LIKE '%'")
##
## mu <- get_mapunit_from_GDB(dsn = dsn, WHERE = "muname LIKE 'Miami'")
##
## co <- get_component_from_GDB(dsn, WHERE = "compname = 'Miami'" AND majcompflag = 'Yes'", childs = FALSE)
```
# f_in_GDB <- fetchGDB(WHERE = "areasymbol LIKE 'IN%'")

---

get_component_from_SDA

*Get SSURGO/STATSGO2 Mapunit Data from Soil Data Access*

**Description**

Functions to download and flatten commonly used tables and from Soil Data Access, and create soil profile collection objects (SPC).

**Usage**

```r
get_component_from_SDA(
  WHERE = NULL,
  duplicates = FALSE,
  childs = TRUE,
  droplevels = TRUE,
  nullFrgsAreZero = TRUE,
  stringsAsFactors = NULL
)
```

```r
get_cointerp_from_SDA(
  WHERE = NULL,
  mrulename = NULL,
  duplicates = FALSE,
  droplevels = TRUE,
  stringsAsFactors = NULL
)
```

```r
get_legend_from_SDA(WHERE = NULL, droplevels = TRUE, stringsAsFactors = NULL)
```

```r
get_lmuaoverlap_from_SDA(
  WHERE = NULL,
  droplevels = TRUE,
  stringsAsFactors = NULL
)
```

```r
get_mapunit_from_SDA(WHERE = NULL, droplevels = TRUE, stringsAsFactors = NULL)
```

```r
get_chorizon_from_SDA(
  WHERE = NULL,
  duplicates = FALSE,
  childs = TRUE,
```
get_component_from_SDA

nullFragAreZero = TRUE,
droplevels = TRUE,
stringsAsFactors = NULL )

fetchSDA(
  WHERE = NULL,
duplicates = FALSE,
  childs = TRUE,
nullFragAreZero = TRUE,
  rmHzErrors = FALSE,
  droplevels = TRUE,
  stringsAsFactors = NULL )

getcosoilmoist_from_SDA(
  WHERE = NULL,
duplicates = FALSE,
impute = TRUE,
  stringsAsFactors = NULL )

Arguments

WHERE text string formatted as an SQL WHERE clause (default: FALSE)
duplicates logical; if TRUE a record is returned for each unique mukey (may be many per nationalmusym)
childs logical; if FALSE parent material and geomorphic child tables are not flattened and appended
droplevels logical: indicating whether to drop unused levels in classifying factors. This is useful when a class has large number of unused classes, which can waste space in tables and figures.
nullFragAreZero should fragment volumes of NULL be interpreted as 0? (default: TRUE), see details
stringsAsFactors deprecated
mrulename character. Interpretation rule names
rmHzErrors should pedons with horizonation errors be removed from the results? (default: FALSE)
impute replace missing (i.e. NULL) values with "Not_Populated" for categorical data, or the "RV" for numeric data or 201 cm if the "RV" is also NULL (default: TRUE)

Details

These functions return data from Soil Data Access with the use of a simple text string that formatted as an SQL WHERE clause (e.g. WHERE = "areasymbol = 'IN001'". All functions are SQL queries that wrap around SDAquery() and format the data for analysis.
get_cosoilmoist_from_NASIS

Beware SDA includes the data for both SSURGO and STATSGO2. The areasymbol for STATSGO2 is US. For just SSURGO, include WHERE = "areareasymbol != 'US'".

If the duplicates argument is set to TRUE, duplicate components are returned. This is not necessary with data returned from NASIS, which has one unique national map unit. SDA has duplicate map national map units, one for each legend it exists in.

The value of nullFragsAreZero will have a significant impact on the rock fragment fractions returned by fetchSDA. Set nullFragsAreZero = FALSE in those cases where there are many data-gaps and NULL rock fragment values should be interpreted as NULLs. Set nullFragsAreZero = TRUE in those cases where NULL rock fragment values should be interpreted as 0.

Additional examples can be found in the Soil Data Access (SDA) Tutorial

Value

A data.frame or SoilProfileCollection object.

Author(s)

Stephen Roecker

SDA_query

get_cosoilmoist_from_NASIS

Get the Component Soil Moisture Tables

Description

Read and flatten the component soil moisture month tables from a local NASIS Database.

Usage

get_cosoilmoist_from_NASIS(
  SS = TRUE,
  impute = TRUE,
  stringsAsFactors = NULL,
  dsn = NULL
)

Arguments

SS fetch data from the currently loaded selected set in NASIS or from the entire local database (default: TRUE)

impute replace missing (i.e. NULL) values with "Not_Populated" for categorical data, or the "RV" for numeric data or 201 cm if the "RV" is also NULL (default: TRUE)
The component soil moisture tables within NASIS house monthly data on flooding, ponding, and soil moisture status. The soil moisture status is used to specify the water table depth for components (e.g. status == "Moist").

Value

A data.frame.

Author(s)

S.M. Roecker

See Also

fetchNASIS, get_cosoilmoist_from_NASISWebReport, get_cosoilmoist_from_SDA, get_comonth_from_SDA

Examples

```r
if(local_NASIS_defined()) {
  # load cosoilmoist (e.g. water table data)
  test <- try(get_cosoilmoist_from_NASIS())
  # inspect
  if(!inherits(test, 'try-error')) {
    head(test)
  }
}
```

---

**get_EDIT_ecoclass_by_geoUnit**

*Get Ecological Dynamics Information Tool (EDIT) ecological sites by catalog (ESD/ESG) and MLRA*

**Description**

Data are accessed via Ecological Dynamics Interpretive Tool (EDIT) web services: https://edit.jornada.nmsu.edu/resources/esd. geoUnit refers to MLRA codes, possibly with a leading zero and trailing "X" for two digit MLRA symbols.
get_extended_data_from_NASIS_db

Get accessory tables and summaries from a local NASIS Database

Description

Get accessory tables and summaries from a local NASIS Database

Usage

get_extended_data_from_NASIS_db(
  SS = TRUE,
  nullFragsAreZero = TRUE,
  stringsAsFactors = NULL,
  dsn = NULL
)

Arguments

SS get data from the currently loaded Selected Set in NASIS or from the entire local
database (default: TRUE)

nullFragsAreZero should fragment volumes of NULL be interpreted as 0? (default: TRUE), see
details
get_extended_data_from_pedon_db

Get accessory tables and summaries from a local pedonPC Database

Description

Get accessory tables and summaries from a local pedonPC Database.

Usage

get_extended_data_from_pedon_db(dsn)

Arguments

dsn  The path to a 'pedon.mdb' database.

Value

A list with the results.

Author(s)

Jay M. Skovlin and Dylan E. Beaudette

See Also

get_hz_data_from_NASIS_db, get_site_data_from_NASIS_db

Examples

if(local_NASIS_defined()) {
  # query extended data
  e <- try(get_extended_data_from_NASIS_db())

  # show contents of extended data
  str(e)
}
Value
A list with the results.

Author(s)
Jay M. Skovlin and Dylan E. Beaudette

See Also
get_hz_data_from_pedon_db, get_site_data_from_pedon_db

get_hz_data_from_NASIS_db

Get Horizon Data from a local NASIS Database

Description
Get horizon-level data from a local NASIS database.

Usage
get_hz_data_from_NASIS_db(
  SS = TRUE,
  fill = FALSE,
  stringsAsFactors = NULL,
  dsn = NULL
)

Arguments

SS fetch data from Selected Set in NASIS or from the entire local database (default: TRUE)
fill include pedons without horizon data in result? default: FALSE
stringsAsFactors deprecated
dsn Optional: path to local SQLite database containing NASIS table structure; default: NULL

Value
A data.frame.

Note
NULL total rock fragment values are assumed to represent an absence of rock fragments, and set to 0.
Description

Get horizon-level data from a PedonPC database.

Usage

get_hz_data_from_pedon_db(dsn)

Arguments

dsn The path to a 'pedon.mdb' database.

Value

A data.frame.

Note

NULL total rock fragment values are assumed to represent an absence of rock fragments, and set to 0.

Author(s)

Dylan E. Beaudette and Jay M. Skovlin

get_colors_from_pedon_db, get_site_data_from_pedon_db
get_lablayer_data_from_NASIS_db

Get lab pedon layer data from a local NASIS Database

Description

Get lab pedon layer-level (horizon-level) data from a local NASIS database.

Usage

get_lablayer_data_from_NASIS_db(SS = TRUE, dsn = NULL)

Arguments

SS          fetch data from the currently loaded selected set in NASIS or from the entire local database (default: TRUE)

dsn         Optional: path to local SQLite database containing NASIS table structure; default: NULL

Value

A data.frame.

Note

This function queries KSSL laboratory site/horizon data from a local NASIS database from the lab layer data table.

Author(s)

Jay M. Skovlin and Dylan E. Beaudette

See Also

get_labpedon_data_from_NASIS_db
get_labpedon_data_from_NASIS_db

Get lab pedon data from a local NASIS Database

Description

Get lab pedon-level data from a local NASIS database.

Usage

get_labpedon_data_from_NASIS_db(SS = TRUE, dsn = NULL)

Arguments

SS fetch data from the currently loaded selected set in NASIS or from the entire
local database (default: TRUE)

dsn Optional: path to local SQLite database containing NASIS table structure; de-
default: NULL

Details

This function currently works only on Windows, and requires a 'nasis_local' ODBC connection.

Value

A data.frame.

Note

This function queries KSSL laboratory site/horizon data from a local NASIS database from the lab
pedon data table.

get_lablayer_data_from_NASIS_db
get_mapunit_from_NASIS

Get Legend, Mapunit and Legend Mapunit Area Overlap Tables

Description
Get Legend, Mapunit and Legend Mapunit Area Overlap Tables

Usage

get_mapunit_from_NASIS(
  SS = TRUE,
  repdmu = TRUE,
  droplevels = TRUE,
  stringsAsFactors = NULL,
  dsn = NULL
)

get_legend_from_NASIS(
  SS = TRUE,
  droplevels = TRUE,
  stringsAsFactors = NULL,
  dsn = NULL
)

get_lmuaoverlap_from_NASIS(
  SS = TRUE,
  droplevels = TRUE,
  stringsAsFactors = NULL,
  dsn = NULL
)

get_projectmapunit_from_NASIS(SS = TRUE, stringsAsFactors = NULL, dsn = NULL)

Arguments

SS
  Fetch data from the currently loaded selected set in NASIS or from the entire
  local database (default: TRUE)

repdmu
  Return only "representative" data mapunits? Default: TRUE

droplevels
  Drop unused levels from farmlndcl and other factor levels from NASIS do-
  mains?

stringsAsFactors
  deprecated

dsn
  Optional: path to local SQLite database containing NASIS table structure; de-
  fault: NULL
get_NASIS_metadata  Get NASIS Metadata (Domain, Column and Choice Lists)

Description
Retrieve a table containing domain and column names with choice list labels/names/sequences/values from the NASIS 7 metadata tables.

Usage
get_NASIS_metadata(dsn = NULL)
get_NASIS_column_metadata(x, what = "ColumnPhysicalName", dsn = NULL)

Arguments
dsn Optional: path to local SQLite database containing NASIS table structure; default: NULL
x character vector to match in NASIS metadata
what Column to match x against. Default "ColumnPhysicalName"; alternate options include "DomainID", "DomainName", "DomainRanked", "DisplayLabel", "ChoiceSequence", "ChoiceValue", "ChoiceName", "ChoiceLabel", "ChoiceObsolete", "ChoiceDescription", "ColumnLogicalName"

Details
These data are derived from the MetadataDomainDetail, MetadataDomainMaster, and MetadataTableColumn tables and help with mapping between values stored in the NASIS database and human-readable values. The human-readable values align with the values returned in public facing interfaces such as SSURGO via Soil Data Access and NASIS Web Reports. The data in these tables can also be used to create ordered factors where options for levels of a particular data element follow a logical ChoiceSequence.

If a local NASIS instance is set up, and this is the first time get_NASIS_metadata() has been called, the metadata will be obtained from the NASIS local database. Subsequent runs in the same session will use a copy of the data object NASIS.metadata cached in soilDB.env.

For users without a local NASIS instance, a cached copy of the NASIS metadata are used (data/metadata.rda). See ?soilDB::metadata for additional details.

Value
a data.frame containing DomainID, DomainName, DomainRanked, DisplayLabel, ChoiceSequence, ChoiceValue, ChoiceName, ChoiceLabel, ChoiceObsolete, ColumnPhysicalName, ColumnLogicalName
a data.frame containing selected NASIS metadata sorted first on DomainID and then on ChoiceSequence
get_NASIS_table_key_by_name

Examples

```r
get_NASIS_metadata()
get_NASIS_column_metadata("texcl")
```

---

get_NASIS_table_key_by_name

*Get a NASIS table key by type and table name*

---

**Description**

Get a NASIS table key by type and table name

**Usage**

```r
get_NASIS_table_key_by_name(
  tables,
  keycol = c("all", "fkey", "pkeyref", "pkey")
)
```

**Arguments**

- **tables**: character vector of table names
- **keycol**: One of: "fkey" the foreign key; "pkeyref" the primary key referenced by the foreign key, or "pkey" the primary key.

**Value**

The key column name for the specified table name

**Examples**

```r
## Not run:
get_NASIS_table_key_by_name(c("site","phorizon_View_1","not_a_table"))

## End(Not run)```

```r
```

```r
```
get_NASIS_table_name_by_purpose

Get NASIS 7 Physical Table Names

Description

Method generalizing concepts of NASIS 7 data model to group tables by "purpose." Most of our more complex queries rely on tables from one or more purposes, so individual higher-level functions might call a function like this to identify the relevant tables from a data source.

Usage

get_NASIS_table_name_by_purpose(
purpose = c("metadata", "lookup", "nasis", "site", "pedon", "transect", "component", "vegetation", "project", "techsoilservice", "area", "soilseries", "legend", "mapunit", "datamapunit"),
SS = FALSE
)

Arguments

purpose character. One or more of: "metadata", "lookup", "nasis", "site", "pedon", "transect", "component", "vegetation", "project", "techsoilservice", "area", "soilseries", "legend", "mapunit", "datamapunit"
SS append "_View_1" on appropriate tables? Default: FALSE

Value

character vector of table names

See Also

createStaticNASIS

Examples

## Not run:
# get the "site" table names
get_NASIS_table_name_by_purpose("site")

# get the pedon table names
get_NASIS_table_name_by_purpose("pedon", SS = TRUE)

# metadata and lookup not affected by SS argument, but site and pedon are
get_NASIS_table_name_by_purpose(c("metadata", "lookup", "site", "pedon"), SS = TRUE)

## End(Not run)
get_NOAA_GHCND

Get Global Historical Climatology Network Daily (GHCND) data from NOAA API

Description

Obtain daily climatic summary data for a set of station IDs, years, and datatypes.

Note that typically results from the NOAA API are limited to 1000 records. However, by "chunking" up data into individual station|year|datatypeid combinations, record results generally do not exceed 365 records for daily summaries.

In order to use this function, you must obtain an API token from this website: https://www.ncdc.noaa.gov/cdo-web/token

Usage

get_NOAA_GHCND(stations, years, datatypeids, apitoken)

Arguments

stations Station ID (e.g. GHCND:USC00388786)
years One or more years (e.g. 2017:2020)
datatypeids One or more NOAA GHCND data type IDs (e.g c("PRCP","SNOW"))
apitoken API key token for NOAA NCDC web services (https://www.ncdc.noaa.gov/cdo-web/token)

Value

A data.frame containing the GHCND data requested (limit 1000 records)

Examples

#' ## in order to use this function, you must obtain an API token from this website:
#' ## https://www.ncdc.noaa.gov/cdo-web/token

# get_NOAA_GHCND(c("GHCND:USC00388786", "GHCND:USC00388787"),
# years = 2017:2020,
# datatypeids = c("PRCP","SNOW"),
# apitoken = "yourtokenhere")
**get_NOAA_stations_nearXY**

*Get NOAA station data near a given latitude and longitude*

**Description**

Query the NOAA API to get station data (limit 1000 records) near a point. Default extent is plus or minus 0.5 degrees (bounding box) (with bbox = 1) around the specified point [lat, lng].

In order to use this function, you must obtain an API token from this website: https://www.ncdc.noaa.gov/cdo-web/token

**Usage**

get_NOAA_stations_nearXY(lat, lng, apitoken, bbox = 1, crs = "EPSG:4326")

**Arguments**

- `lat`  
  Latitude or Y coordinate in `crs`

- `lng`  
  Longitude or X coordinate in `crs`

- `apitoken`  
  API key token for NOAA NCDC web service

- `bbox`  
  Optional: Dimension of the bounding box centered at `lat, lng`.

- `crs`  
  Coordinate Reference System. Default "EPSG:4326"

**Value**

`data.frame` containing station information for all stations within a bounding box around lat, lng.

**Examples**

```r
## in order to use this function, you must obtain an API token from this website:
## https://www.ncdc.noaa.gov/cdo-web/token

# stations <- get_NOAA_stations_nearXY(lat = 37, lng = -120,
#                                       apitoken = "yourtokenhere")
```
get_OSD

*Get Official Series Description Data from JSON, HTML or TXT sources*

**Description**

Get Official Series Description Data from JSON, HTML or TXT sources

**Usage**

```r
get_OSD(
  series,
  base_url = NULL,
  result = c("json", "html", "txt"),
  fix_ocr_errors = FALSE,
  verbose = FALSE
)
```

```r
get_OSD_JSON(series, base_url = NULL)
```

**Arguments**

- **series**: A character vector of Official Series names e.g. "Chewacla"
- **base_url**: Optional: alternate JSON/HTML/TXT repository path. Default: NULL uses "https://github.com/ncss-tech/SoilKnowledgeBase" for result="json"
- **result**: Select "json", "html", or "txt" output
- **fix_ocr_errors**: Default: FALSE; Applies only to result='json'. Convert clear cases of Optical Character Recognition (OCR) errors to likely actual values.
- **verbose**: Print errors and warning messages related to HTTP requests? Default: FALSE

**Details**

The default base_url for result="json" is to JSON files stored in a GitHub repository that is regularly updated from the official source of Series Descriptions. Using format: https://raw.githubusercontent.com/ncss-tech/SoilKnowledgeBase/main/inst/extdata/OSD/{LETTER}/{SERIES}.json for JSON. And "https://soilseriesdesc.sc.egov.usda.gov/OSD_Docs/{LETTER}/{SERIES}.html is for result="html" (official source).

**fix_ocr_errors** by default is turned off (FALSE). When TRUE, assume that in color data hue/value/chrroma lowercase "L" ("l") is a 1, and a capital "O" is interpreted as zero. Also, in horizon designations assume lowercase "L" is a 1, and a string that starts with 0 starts with the capital letter "O".

**Value**

For JSON result: A data.frame with 1 row per series, and 1 column per "section" in the OSD as defined in National Soil Survey Handbook. For TXT or HTML result a list of character vectors containing OSD text with 1 element per series and one value per line.
get_SDA_coecoclass

Examples

```r
if(requireNamespace("curl") &
   curl::has_internet()) {

  series <- c("Musick", "Hector", "Chewacla")
  get_OSD(series)
}
```

get_SDA_coecoclass  Get mapunit ecological sites from Soil Data Access

Description

Get mapunit ecological sites from Soil Data Access

Usage

```r
get_SDA_coecoclass(
  method = "None",
  areasymbols = NULL,
  mukeys = NULL,
  WHERE = NULL,
  query_string = FALSE,
  ecoclasstypename = NULL,
  ecoclassref = "Ecological Site Description Database",
  not_rated_value = "Not assigned",
  miscellaneous_areas = TRUE,
  dsn = NULL
)
```

Arguments

- `method`: aggregation method. One of: "Dominant Component", "Dominant Condition", "None". If "None" is selected one row will be returned per component, otherwise one row will be returned per map unit.
- `areasymbols`: vector of soil survey area symbols
- `mukeys`: vector of map unit keys
- `WHERE`: character containing SQL WHERE clause specified in terms of fields in legend, mapunit, component or coecosite tables, used in lieu of mukeys or areasymbols
- `query_string`: Default: FALSE; if TRUE return a character string containing query that would be sent to SDA via SDA_query
- `ecoclasstypename`: If NULL no constraint on ecoclasstypename is used in the query.
get_SDA_cosurfmorph

ecoclassref  Default: "Ecological Site Description Database". If NULL no constraint on ecoclassref is used in the query.

not_rated_value  Default: "Not assigned"

miscellaneous_areas  Include miscellaneous areas (non-soil components)?

dsn  Path to local SQLite database or a DBIConnection object. If NULL (default) use Soil Data Access API via SDA_query().

Details

When method="Dominant Condition" an additional field ecoclasspct_r is returned in the result with the sum of comppct_r that have the dominant condition ecoclassid. The component with the greatest comppct_r is returned for the component and coecosite level information.

Note that if there are multiple coecoclasskey per ecoclassid there may be more than one record per component.

Description

Get Geomorphic/Surface Morphometry Data from Soil Data Access or a local SSURGO data source and summarize by counts and proportions ("probabilities").

Usage

get_SDA_cosurfmorph(
  table = c("cosurfmorphgc", "cosurfmorphhpp", "cosurfmorphss", "cosurfmorphmr"),
  by = "compname",
  areasymbols = NULL,
  mukeys = NULL,
  WHERE = NULL,
  db = c("SSURGO", "STATSGO"),
  dsn = NULL,
  query_string = FALSE
)

Arguments

table  Target table to summarize. Default: "cosurfmorphgc" (3D Geomorphic Component). Alternate choices include cosurfmorphhpp (2D Hillslope Position), cosurfmorphss (Surface Shape), and cosurfmorphmr (Microrelief).

by  Grouping variable. Default: "compname"

areasymbols  A vector of soil survey area symbols (e.g. 'CA067')
get_SDA_cosurfmorph

mukeys  A vector of map unit keys (e.g. 466627)
WHERE  WHERE clause added to SQL query. For example: areasymbol = 'CA067'
db     Either 'SSURGO' (default) or 'STATSGO'. If 'SSURGO' is specified areasymbol = 'US' records are excluded. If 'STATSGO' only areasymbol = 'US' records are included.
dsn     Path to local SSURGO database SQLite database. Default NULL uses Soil Data Access.
query_string  Return query instead of sending to Soil Data Access / local database. Default: FALSE.

Details

Default table="cosurfmorphgc" summarizes columns geomposmntn, geomposhill, geomposflats, and geompostrce. table="cosurfmorphhpp" summarizes "hillslopeprof", table="cosurfmorphss" summarizes shapeacross and shapedown, and table="cosurfmorphmr" summarizes geomicrorelief.

Queries are a generalization of now-deprecated functions from sharpshootR by Dylan Beaudette: geomPosMountainProbability(), geomPosHillProbability(), surfaceShapeProbability(), hillslopeProbability()

Similar summaries of SSURGO component surface morphometry data by series name can be found in fetchOSD(), extended=TRUE) or downloaded from https://github.com/ncss-tech/SoilWeb-data Full component data including surface morphometry summaries at the "site" level can be obtained with fetchSDA().

Value

a data.frame containing the grouping variable (by) and tabular summaries of counts and proportions of geomorphic records.

Examples

```r
## Not run:
# Summarize by 3D geomorphic components by component name (default 'by='compname''
get_SDA_cosurfmorph(WHERE = "areasymbol = 'CA630'")

# Whole Soil Survey Area summary (using 'by = 'areasymbol'')
get_SDA_cosurfmorph(by = 'areasymbol', WHERE = "areasymbol = 'CA630'")

# 2D Hillslope Position summary(using 'table = 'cosurfmorphhpp'')
g get_SDA_cosurfmorph('cosurfmorphhpp', WHERE = "areasymbol = 'CA630'")

# Surface Shape summary (using 'table = 'cosurfmorphss'')
```
get_SDA_hydric

get_SDA_cosurfmorph('cosurfmorphss', WHERE = "areasymbol = 'CA630'")

# Microrelief summary (using `table = 'cosurfmorphmr'`) get_SDA_cosurfmorph('cosurfmorphmr', WHERE = "areasymbol = 'CA630'")

## End(Not run)

get_SDA_hydric  

*Get map unit hydric soils information from Soil Data Access*

### Description

Assess the hydric soils composition of a map unit.

### Usage

```r
get_SDA_hydric(
  areasymbols = NULL,
  mukeys = NULL,
  WHERE = NULL,
  method = "MAPUNIT",
  query_string = FALSE,
  dsn = NULL
)
```

### Arguments

- `areasymbols`: vector of soil survey area symbols
- `mukeys`: vector of map unit keys
- `WHERE`: character containing SQL WHERE clause specified in terms of fields in legend, mapunit, or component tables, used in lieu of mukeys or areasymbols
- `method`: One of: "Mapunit", "Dominant Component", "Dominant Condition", "None"
- `query_string`: Default: FALSE; if TRUE return a character string containing query that would be sent to SDA via SDA_query()
- `dsn`: Path to local SQLite database or a DBIConnection object. If NULL (default) use Soil Data Access API via SDA_query().

### Details

The default classes for `method="MAPUNIT"` are as follows:

- 'Nonhydric' - no hydric components
- 'Hydric' - all hydric components
- 'Predominantly Hydric' - hydric component percentage is 50% or more
- 'Partially Hydric' - one or more of the major components is hydric
• 'Predominantly Nonhydric' - hydric component percentage is less than 50%

The default result will also include the following summaries of component percentages: total_comppct, hydric_majors and hydric_inclusions.

Default method "Mapunit" produces aggregate summaries of all components in the mapunit. Use "Dominant Component" and "Dominant Condition" to get the dominant component (highest percentage) or dominant hydric condition (similar conditions aggregated across components), respectively. Use "None" for no aggregation (one record per component).

Value

a data.frame

Author(s)

Jason Nemecek, Chad Ferguson, Andrew Brown

---

**get_SDA_interpretation**

Get map unit interpretations from Soil Data Access by rule name

### Description

Get map unit interpretations from Soil Data Access by rule name

### Usage

```r
get_SDA_interpretation(
  rulename, 
  method = c("Dominant Component", "Dominant Condition", "Weighted Average", "None"), 
  areasymbols = NULL, 
  mukeys = NULL, 
  WHERE = NULL, 
  query_string = FALSE, 
  not_rated_value = NA_real_, 
  dsn = NULL
)
```

### Arguments

- **rulename** character vector of interpretation rule names (matching mruleid in cointerp table)
- **method** aggregation method. One of: "Dominant Component", "Dominant Condition", "Weighted Average", "None". If "None" is selected one row will be returned per component, otherwise one row will be returned per map unit.
- **areastatements** vector of soil survey area symbols
- **mukeys** vector of map unit keys
get_SDA_interpretation

WHERE
class character containing SQL WHERE clause specified in terms of fields in legend,
mapunit, or component tables, used in lieu of mukeys or areasymbols

query_string
Default: FALSE; if TRUE return a character string containing query that would be
sent to SDA via SDA_query

not_rated_value
used where rating class is "Not Rated". Default: NA_real

dsn
Path to local SQLite database or a DBIConnection object. If NULL (default) use
Soil Data Access API via SDA_query().

Value

a data.frame

Author(s)

Jason Nemecek, Chad Ferguson, Andrew Brown

Examples

if(requireNamespace("curl") &
  curl::has_internet()) {

  # get two forestry interpretations for CA630
  get_SDA_interpretation(c("FOR - Potential Seedling Mortality",
    "FOR - Road Suitability (Natural Surface)",
    method = "Dominant Condition",
    areasymbols = "CA630")
}

get_SDA_metrics(query_name, query_frequency, query_year, state = NULL)

Description

Obtain pre-calculated tabular reports of usage, activities, areas of interest (AOI), exports, ecological sites, ratings and reports for specific areas, times and intervals.

Usage

get_SDA_metrics(query_name, query_frequency, query_year, state = NULL)
get_SDA_muaggatt

get_SDA_muaggatt

Get map unit aggregate attribute information from Soil Data Access

Description

Get map unit aggregate attribute information from Soil Data Access

Usage

get_SDA_muaggatt(
  areasymbols = NULL,
  mukeys = NULL,
  WHERE = NULL,
  query_string = FALSE,
  dsn = NULL
)
get_SDA_pmgroupname

Arguments

- **areasymbols**: vector of soil survey area symbols
- **mukeys**: vector of map unit keys
- **WHERE**: character containing SQL WHERE clause specified in terms of fields in legend, mapunit, or muaggatt tables, used in lieu of mukeys or areasymbols
- **query_string**: Default: FALSE; if TRUE return a character string containing query that would be sent to SDA via SDA_query
- **dsn**: Path to local SQLite database or a DBIConnection object. If NULL (default) use Soil Data Access API via SDA_query()

Value

a data.frame

Author(s)

Jason Nemecek, Chad Ferguson, Andrew Brown

---

get_SDA_pmgroupname  
*Get map unit parent material group information from Soil Data Access*

Description

Get map unit parent material group information from Soil Data Access

Usage

```r
get_SDA_pmgroupname(
  areasymbols = NULL,
  mukeys = NULL,
  WHERE = NULL,
  method = "DOMINANT COMPONENT",
  simplify = TRUE,
  query_string = FALSE,
  dsn = NULL
)
```

Arguments

- **areasymbols**: vector of soil survey area symbols
- **mukeys**: vector of map unit keys
- **WHERE**: character containing SQL WHERE clause specified in terms of fields in legend, mapunit, component, or copmgrp tables, used in lieu of mukeys or areasymbols
- **method**: One of: "Dominant Component", "Dominant Condition", "None"
- **simplify**: logical: group into generalized parent material groups? Default TRUE
query_string  Default: FALSE; if TRUE return a character string containing query that would be sent to SDA via SDA_query

dsn  Path to local SQLite database or a DBIConnection object. If NULL (default) use Soil Data Access API via SDA_query().

Details

Default method is "Dominant Component" to get the dominant component (highest percentage). Use "Dominant Condition" or dominant parent material condition (similar conditions aggregated across components). Use "None" for no aggregation (one record per component).

Value

a data.frame

Author(s)

Jason Nemecek, Chad Ferguson, Andrew Brown

get_SDA_property  Get map unit properties from Soil Data Access

Description

Get map unit properties from Soil Data Access

Usage

get_SDA_property(
  property,
  method = c("Dominant Component (Category)", "Weighted Average", "Min/Max",
    "Dominant Component (Numeric)", "Dominant Condition", "None"),
  areasymbols = NULL,
  mukeys = NULL,
  WHERE = NULL,
  top_depth = 0,
  bottom_depth = 200,
  FUN = NULL,
  include_minors = FALSE,
  miscellaneous_areas = FALSE,
  query_string = FALSE,
  dsn = NULL
)
get_SDA_property

Arguments

property  character vector of labels from property dictionary tables (see details) OR physical column names from component or chorizon table.

method  one of: "Dominant Component (Category)", "Dominant Component (Numeric)", "Weighted Average", "MIN", "MAX", "Dominant Condition", or "None". If "None" is selected, the number of rows returned will depend on whether a component or horizon level property was selected, otherwise the result will be 1:1 with the number of map units.

areasymbols  vector of soil survey area symbols

mukeys  vector of map unit keys

WHERE  character containing SQL WHERE clause specified in terms of fields in legend or mapunit tables, used in lieu of mukeys or areasymbols. With aggregation method "NONE" the WHERE clause may additionally contain logic for columns from the component and chorizon table.

top_depth  Default: 0 (centimeters); a numeric value for upper boundary (top depth) used only for method="Weighted Average", "Dominant Component (Numeric)", and "MIN/MAX"

bottom_depth  Default: 200 (centimeters); a numeric value for lower boundary (bottom depth) used only for method="Weighted Average", "Dominant Component (Numeric)", and "MIN/MAX"

FUN  Optional: character representing SQL aggregation function either "MIN" or "MAX" used only for method="min/max"; this argument is calculated internally if you specify method="MIN" or method="MAX"

include_minors  Include minor components in "Weighted Average" or "MIN/MAX" results? Default: TRUE

miscellaneous_areas  Include miscellaneous areas (non-soil components) in results? Default: FALSE. Now works with all method types

query_string  Default: FALSE; if TRUE return a character string containing query that would be sent to SDA via SDA_query()

dsn  Path to local SQLite database or a DBIConnection object. If NULL (default) use Soil Data Access API via SDA_query().

Details

The property argument refers to one of the property names or columns specified in the tables below. Note that property can be specified as either a character vector of labeled properties, such as "Bulk Density 0.33 bar H2O - Rep Value", or physical column names such as "dbthirdbar_r". To get "low" and "high" values for a particular property, replace the _r with _l or _h in the physical column name; for example property = c("dbthirdbar_l", "dbthirdbar_r", "dbthirdbar_h"). You can view exhaustive lists of component and component horizon level properties in the Soil Data Access "Tables and Columns Report".

                   data = ...)
}
get_SDV_legend_elements

Get Soil Data Viewer Attribute Information

Description

Get Soil Data Viewer Attribute Information

Usage

get_SDV_legend_elements(
    WHERE,  
    alpha = 255,
    notratedcolor = rgb(1, 1, 1, 0),
    simplify = TRUE
)

Arguments

WHERE WHERE clause for query of Soil Data Access sdvattribute table
alpha transparency value applied in calculation of hexadecimal color. Default: 255 (opaque).
notratedcolor Used to add 'Not rated' color entries where applicable. Default: "#FFFFFF00" (transparent white).
simplify Return a data.frame when WHERE is length 1? Return a list with 1 element per legend when WHERE is length > 1? Default: TRUE

Value

A list with a data.frame element for each element of where containing "attributekey", "attributename", "attributetype", "attributetablename", "attributetablename", "attributecolumnname", "attributedescription", "nasisrulename", "label", "order", "value", "lower_value", "upper_value", "red", "green", "blue" and "hex" columns.
get_site_data_from_NASIS_db

Get Site Data from a local NASIS Database

Description

Get site-level data from a local NASIS database.

Usage

get_site_data_from_NASIS_db(
  SS = TRUE,
  nullFragsAreZero = TRUE,
  stringsAsFactors = NULL,
  dsn = NULL
)

Arguments

SS fetch data from Selected Set in NASIS or from the entire local database (default: TRUE)

nullFragsAreZero should surface fragment cover percentages of NULL be interpreted as 0? (default: TRUE)

stringsAsFactors deprecated

dsn Optional: path to local SQLite database containing NASIS table structure; default: NULL

Details

When multiple "site bedrock" entries are present, only the shallowest is returned by this function.

Value

A data.frame

Author(s)

Jay M. Skovlin and Dylan E. Beaudette

See Also

get_hz_data_from_NASIS_db
get_site_data_from_pedon_db

Get Site Data from a PedonPC Database

Description

Get site-level data from a PedonPC database.

Usage

get_site_data_from_pedon_db(dsn)

Arguments

dsn The path to a ’pedon.mdb’ database.

Value

A data.frame.

Author(s)

Dylan E. Beaudette and Jay M. Skovlin

See Also

get_hz_data_from_pedon_db, get_veg_from_AK_Site.

get_soilseries_from_NASIS

Get records from the Series Classification (SC) database

Description

These functions return records from the Series Classification (SC) database, either from the local
NASIS database (all series) or via web report (named series only).

get_competing_soilseries_from_NASIS(): Get Soil Series from NASIS Matching Taxonomic
Class Name
**Usage**

get_soilseries_from_NASIS(
        stringsAsFactors = NULL,
        dsn = NULL,
        delimiter = " over "
    )

get_soilseries_from_NASISWebReport(soils, stringsAsFactors = NULL)

get_competing_soilseries_from_NASIS(x, what = "taxclname", dsn = NULL)

**Arguments**

- **stringsAsFactors**  
  deprecated
- **dsn**  
  Optional: path to local SQLite database containing NASIS table structure; default: NULL
- **delimiter**  
  character. Used to collapse taxminalogy records where multiple values are used to describe strongly contrasting control sections. Default " over " creates combination mineralogy classes as they would be used in the family name.
- **soils**  
  A vector of soil series names
- **x**  
  Taxonomic Class Name (or other field specified by what) to match, use % for wildcard
- **what**  
  Column name to match x against, default: 'taxclname'

**Value**

A data.frame

**Author(s)**

Stephen Roecker

---

**get_text_notes_from_NASIS_db**

*Get text note data from a local NASIS Database*

**Description**

Get text note data from a local NASIS Database

**Usage**

get_text_notes_from_NASIS_db(SS = TRUE, fixLineEndings = TRUE, dsn = NULL)

get_mutext_from_NASIS_db(SS = TRUE, fixLineEndings = TRUE, dsn = NULL)

get_cotext_from_NASIS_db(SS = TRUE, fixLineEndings = TRUE, dsn = NULL)
get_veg_data_from_NASIS_db

Get vegetation data from a local NASIS Database

Description

Get veg data from a local NASIS Database.

Usage

get_veg_data_from_NASIS_db(SS = TRUE, dsn = NULL)
get_veg_from_AK_Site

Arguments

SS  get data from the currently loaded Selected Set in NASIS or from the entire local database (default: TRUE)

dsn  Optional: path to local SQLite database containing NASIS table structure; default: NULL

Value

A list with the results.

Author(s)

Jay M. Skovlin and Dylan E. Beaudette

Examples

```r
if(local_NASIS_defined()) {
  # query text note data
  v <- try(get_veg_from_NASIS_db())

  # show contents veg data returned
  str(v)
}
```

---

get_veg_from_AK_Site  Get Vegetation Data from an AK Site Database

Description

Get Vegetation Data from an AK Site Database

Usage

get_veg_from_AK_Site(dsn)

Arguments

dsn  file path the the AK Site access database

Value

A data.frame with vegetation data in long format, linked to site ID.
get_veg_from_MT_veg_db

Description
Get Site and Plot-level data from a Montana RangeDB database.

Usage
get_veg_from_MT_veg_db(dsn)

Arguments
dsn The name of the Montana RangeDB front-end database connection (see details).

Value
A data.frame.

Author(s)
Jay M. Skovlin

See Also
get_veg_species_from_MT_veg_db, get_veg_other_from_MT_veg_db
get_veg_from_NPS_PLOTS_db

Get Vegetation Data from an NPS PLOTS Database

Description

Used to extract species, stratum, and cover vegetation data from a backend NPS PLOTS Database. Currently works for any Microsoft Access database with an .mdb file format.

Usage

get_veg_from_NPS_PLOTS_db(dsn)

Arguments

dsn file path to the NPS PLOTS access database on your system.

Value

A data.frame with vegetation data in a long format with linkage to NRCS soil pedon data via the site_id key field.

Note

This function currently only works on Windows.

Author(s)

Jay M. Skovlin

get_veg_other_from_MT_veg_db

Get cover composition data from a Montana RangeDB database

Description

Get cover composition data from a Montana RangeDB database.

Usage

get_veg_other_from_MT_veg_db(dsn)

Arguments

dsn The name of the Montana RangeDB front-end database connection (see details).
get_veg_species_from_MT_veg_db

Description
Get species-level data from a Montana RangeDB database.

Usage
get_veg_species_from_MT_veg_db(dsn)

Arguments

dsn The name of the Montana RangeDB front-end database connection (see details).

Value
A data.frame.

Author(s)
Jay M. Skovlin

See Also
get_veg_from_MT_veg_db, get_veg_other_from_MT_veg_db
Get 800m gridded soil properties from SoilWeb ISSR-800 Web Coverage Service (WCS)

Description

Intermediate-scale gridded (800m) soil property and interpretation maps from aggregated SSURGO and STATSGO data. These maps were developed by USDA-NRCS-SPSD staff in collaboration with UCD-LAWR. Originally for educational use and interactive thematic maps, these data are a suitable alternative to gridded STATSGO-derived thematic soil maps. The full size grids can be downloaded here.

Usage

ISSR800.wcs(aoi, var, res = 800, quiet = FALSE)

Arguments

aoi area of interest (AOI) defined using a Spatial*, RasterLayer, sf, sfc or bbox object, OR a list, see details
var ISSR-800 grid name (case insensitive), see details
res grid resolution, units of meters. The native resolution of ISSR-800 grids (this WCS) is 800m.
quiet logical, passed to curl::curl_download to enable / suppress URL and progress bar for download.

Details

aoi should be specified as a SpatRaster, Spatial*, RasterLayer, SpatRaster/SpatVector, sf, sfc, or bbox object or a list containing:

aoi bounding-box specified as (xmin, ymin, xmax, ymax) e.g. c(-114.16, 47.65, -114.08, 47.68)
crs coordinate reference system of BBOX, e.g. ‘OGC:CRS84’ (EPSG:4326, WGS84 Longitude/Latitude)

The WCS query is parameterized using a rectangular extent derived from the above AOI specification, after conversion to the native CRS (EPSG:5070) of the ISSR-800 grids.

Variables available from this WCS can be queried using WCS_details(wcs = 'ISSR800').

Value

A SpatRaster (or RasterLayer) object containing indexed map unit keys and associated raster attribute table or a try-error if request fails. By default, spatial classes from the terra package are returned. If the input object class is from the raster or sp packages a RasterLayer is returned.
Note

There are still some issues to be resolved related to the encoding of NA Variables with a natural zero (e.g. SAR) have 0 set to NA.

Author(s)

D.E. Beaudette and A.G. Brown

Examples

```r
## Not run:
library(terra)

# see WCS_details() for variable options
WCS_details(wcs = 'ISSR800')

# get wind erodibility group
res <- ISSR800.wcs(list(aoi = c(-116, 35, -115.5, 35.5), crs = "EPSG:4326"),
                   var = 'weg', res = 800)
plot(res)

## End(Not run)
```

---

**KSSL_VG_model**

**Develop a Water Retention Curve from KSSL Data**

**Description**

Water retention curve modeling via van Genuchten model and KSSL data.

**Usage**

```r
KSSL_VG_model(VG_params, phi_min = 10^-6, phi_max = 10^8, pts = 100)
```

**Arguments**

- **VG_params**: data.frame or list object with the parameters of the van Genuchten model, see details
- **phi_min**: lower limit for water potential in kPa
- **phi_max**: upper limit for water potential in kPa
- **pts**: number of points to include in estimated water retention curve
Details

This function was developed to work with measured or estimated parameters of the van Genuchten model, as generated by the Rosetta model. As such, VG_params should have the following format and conventions:

- **theta_r** saturated water content, values should be in the range of \{0, 1\}
- **theta_s** residual water content, values should be in the range of \{0, 1\}
- **alpha** related to the inverse of the air entry suction, function expects log10-transformed values with units of 1/cm
- **npar** index of pore size distribution, function expects log10-transformed values (dimensionless)

Value

A list with the following components:

- **VG_curve** estimated water retention curve: paired estimates of water potential (phi) and water content (theta)
- **VG_function** spline function for converting water potential (phi, units of kPa) to estimated volumetric water content (theta, units of percent, range: \{0, 1\})
- **VG_inverse_function** spline function for converting volumetric water content (theta, units of percent, range: \{0, 1\}) to estimated water potential (phi, units of kPa)

Note

A practical example is given in the fetchSCAN tutorial.

Author(s)

D.E. Beaudette

References

- water retention curve estimation

Examples

```r
# basic example
d <- data.frame(
    theta_r = 0.0337216,
    theta_s = 0.4864061,
    alpha = -1.581517,
    npar = 0.1227247
)

vg <- KSSL_VG_model(d)

str(vg)
```
**Example SoilProfilecollection Objects Returned by fetchNASIS.**

**Description**

Several examples of soil profile collections returned by fetchNASIS(from='pedons') as SoilProfileCollection objects.

**Examples**

```r
if (require("aqp") && requireNamespace("scales")) {
  # load example dataset
data("gopheridge")

  # what kind of object is this?
  class(gopheridge)

  # how many profiles?
  length(gopheridge)

  # there are 60 profiles, this calls for a split plot
  par(mar=c(0,0,0,0), mfrow=c(2,1))

  # plot soil colors
  plot(gopheridge[1:30, ], name='hzname', color='soil_color')
  plot(gopheridge[31:60, ], name='hzname', color='soil_color')

  # need a larger top margin for legend
  par(mar=c(0,0,4,0), mfrow=c(2,1))
  # generate colors based on clay content
  plot(gopheridge[1:30, ], name='hzname', color='clay')
  plot(gopheridge[31:60, ], name='hzname', color='clay')

  # single row and no labels
  par(mar=c(0,0,0,0), mfrow=c(1,1))
  # plot soils sorted by depth to contact
  plot(gopheridge, name='', print.id=FALSE, plot.order=order(gopheridge$bedrckdepth))

  # plot first 10 profiles
  plot(gopheridge[1:10, ], name='hzname', color='soil_color', label='pedon_id', id.style='side')

  # add rock fragment data to plot:
  addVolumeFraction(gopheridge[1:10, ], colname='total_frags_pct')

  # add diagnostic horizons
  addDiagnosticBracket(gopheridge[1:10, ], kind='argillic horizon', col='red', offset=-0.4)
}
```

---

**loafercreek**
data("loafercreek")
# plot first 10 profiles
plot(loafercreek[1:10, ], name='hzname', color='soil_color', label='pedon_id', id.style='side')

# add rock fragment data to plot:
addVolumeFraction(loafercreek[1:10, ], colname='total_frags_pct')

# add diagnostic horizons
addDiagnosticBracket(loafercreek[1:10, ], kind='argillic horizon', col='red', offset=-0.4)

---

**local_NASIS_defined**  
*Check for presence of nasis_local ODBC data source*

**Description**
Check for presence of a NASIS data source. This function *always* returns FALSE when the odbc package is not available (regardless of whether you have an ODBC data source properly set up).

**Usage**
local_NASIS_defined(dsn = NULL)

**Arguments**
- **dsn**
  Optional: path to local SQLite database, or a DBIConnection, containing NASIS table structure; default: NULL

**Details**
If dsn is specified as a character vector it is assumed to refer to a SQLite data source. The result will be TRUE or FALSE depending on the result of RSQLite::dbCanConnect().

If dsn is specified as a DBIConnection the function returns the value of DBI::dbExistsTable("MetadataDomainMaster")

**Value**
logical

**Examples**

```r
if(local_NASIS_defined()) {
  # use fetchNASIS or some other lower-level fetch function
} else {
  message('could not find `nasis_local` ODBC data source')
}
```
**makeChunks**  
*Generate chunk labels for splitting data*

---

**Description**

Generate chunk labels for splitting data

**Usage**

```r
makeChunks(ids, size = 100)
```

**Arguments**

- **ids**: vector of IDs
- **size**: chunk (group) size

**Value**

A numeric vector

**Examples**

```r
# split the lowercase alphabet into 2 chunks
aggregate(letters,
    by = list(makeChunks(letters, size=13)),
    FUN = paste0, collapse="",")
```

---

**make_EDIT_service_URL**  
*Make Ecological Dynamics Interpretive Tool (EDIT) web services URL*

---

**Description**

Construct a URL for Ecological Dynamics Interpretive Tool (EDIT) web services (https://edit.jornada.nmsu.edu/services/) to return PDF, TXT or JSON results.
make_EDIT_service_URL

Usage

make_EDIT_service_URL(
  src = c("descriptions", "downloads", "plant-community-tables", "models", "keys"),
  catalog = c("esd", "esg"),
  geoUnit = NULL,
  ecoclass = NULL,
  landuse = NULL,
  state = NULL,
  community = NULL,
  key = NULL,
  endpoint = NULL,
  querystring = NULL
)

Arguments

src      One of: descriptions, downloads, plant-community-tables, models, keys
catalog  Catalog ID. One of: esd or esg
geoUnit  Geographic unit ID. For example: 022A
classID  Ecological class ID. For example: F022AX101CA
landuse  Optional: Used only for src = "plant-community-tables"
state    Optional: Used only for src = "plant-community-tables"
community Optional: Used only for src = "plant-community-tables"
key      Optional: Key number. All keys will be returned if not specified.
endpoint Optional: Specific endpoint e.g. overview.json, class-list.json, soil-features.json
querystring Optional: Additional request parameters specified as a query string ?param1=value&param2=value.

Details

See the following official EDIT developer resources to see which endpoints are available for Ecological Site Description (ESD) or Ecological Site Group (ESG) catalogs:

- https://edit.jornada.nmsu.edu/resources/esd
- https://edit.jornada.nmsu.edu/resources/esg

Value

A character vector containing URLs with specified parameters. This function is vectorized.

See Also

get_EDIT_ecoclass_by_geoUnit
Examples

# url for all geoUnit keys as PDF
make_EDIT_service_URL(src = "descriptions",
catalog = "esd",
geoUnit = "039X")

# url for a single key within geoUnit as PDF
make_EDIT_service_URL(src = "descriptions",
catalog = "esd",
geoUnit = "039X",
key = "1")

# query for "full" description in JSON
desc <- make_EDIT_service_URL(src = "descriptions",
catalog = "esd",
geoUnit = "039X",
endpoint = "R039XA109AZ.json")

# query for "overview"
desc_ov <- make_EDIT_service_URL(src = "descriptions",
catalog = "esd",
geoUnit = "039X",
ecoclass = "R039XA109AZ",
endpoint = "overview.json")

# query for specific section, e.g. "water features"
desc_wf <- make_EDIT_service_URL(src = "descriptions",
catalog = "esd",
geoUnit = "039X",
ecoclass = "R039XA109AZ",
endpoint = "water-features.json")

# construct the URLs -- that is a query essentially
# then download the result with read_json

#full <- jsonlite::read_json(desc)
#overview <- jsonlite::read_json(desc_ov)
#waterfeature <- jsonlite::read_json(desc_wf)
**Format**

A `data.frame` with the following columns:

- **DomainID** - Integer. ID that uniquely identifies a domain in a data model, not just within a database.
- **DomainName** - Character. Domain Name.
- **DomainRanked** - Integer. Is domain ranked? 0 = No; 1 = Yes
- **DisplayLabel** - Character. Domain Display Label.
- **ChoiceSequence** - Integer. Order or sequence of Choices.
- **ChoiceValue** - Integer. Value of choice level.
- **ChoiceName** - Character. Name of choice level.
- **ChoiceLabel** - Character. Label of choice level.
- **ChoiceObsolete** - Integer. Is choice level obsolete? 0 = No; 1 = Yes
- **ColumnPhysicalName** - Character. Physical column name.
- **ColumnLogicalName** - Character. Logical column name.

---

**mukey.wcs**

*Get gNATSGO / gSSURGO Map Unit Key (mukey) grid from SoilWeb Web Coverage Service (WCS)*

---

**Description**

Download chunks of the gNATSGO or gSSURGO map unit key grid via bounding-box from the SoilWeb WCS.

**Usage**

```r
mukey.wcs(aoi, db = c("gNATSGO", "gSSURGO", "RSS"), res = 30, quiet = FALSE)
```

**Arguments**

- **aoi**
  - area of interest (AOI) defined using either a `Spatial*`, `RasterLayer`, `sf`, `sfc` or `bbox` object, or a list, see details
- **db**
  - name of the gridded map unit key grid to access, should be either 'gNATSGO' or 'gSSURGO' (case insensitive)
- **res**
  - grid resolution, units of meters. The native resolution of gNATSGO and gSSURGO (this WCS) is 30m; and Raster Soil Surveys (RSS) are at 10m resolution. If `res` is not specified the native resolution of the source is used.
- **quiet**
  - logical, passed to `curl::curl_download` to enable / suppress URL and progress bar for download.
Details

`aoi` should be specified as one of: `SpatRaster`, `Spatial*`, `RasterLayer`, `sf`, `sfc`, `bbox` object, OR a list containing:

- `aoi` bounding-box specified as `(xmin, ymin, xmax, ymax)` e.g. `c(-114.16, 47.65, -114.08, 47.68)`
- `crs` coordinate reference system of `bbox`, e.g. 'OGC:CRS84' (EPSG:4326, WGS84 Longitude/Latitude)

The WCS query is parameterized using a rectangular extent derived from the above AOI specification, after conversion to the native CRS (EPSG:5070) of the gNATSGO / gSSURGO grid. Databases available from this WCS can be queried using `WCS_details(wcs = 'mukey')`.

Value

A `SpatRaster` (or `RasterLayer`) object containing indexed map unit keys and associated raster attribute table or a try-error if request fails. By default, spatial classes from the `terra` package are returned. If the input object class is from the `raster` or `sp` packages a `RasterLayer` is returned.

Note

The gNATSGO grid includes raster soil survey map unit keys which are not in SDA.

Author(s)

D.E. Beaudette and A.G. Brown

Examples

```r
## Not run:
library(terra)
res <- mukey.wcs(list(aoi = c(-116.7400, 35.2904, -116.7072, 35.3026), crs = "EPSG:4326"),
                 db = 'gNATSGO', res = 30)
MUKEY <- unique(values(res))
prp <- setNames(
    get_SDA_property(
        c("ph1to1h2o_r", "claytotal_r"),
        "weighted average",
        mukeys = MUKEY,
        top_depth = 0,
        bottom_depth = 25,
        include_minors = TRUE,
        miscellaneous_areas = FALSE
    ),
    c("mukey", "ph1to1h2o_r", "claytotal_r"),
    c("ID", "ph1to1_0to25", "clay_0to25")
)
levels(res) <- prp
res2 <- catalyze(res)
```
```r
res2
plot(res2[['pH1to1_0to25']])
## End(Not run)
```

## NASISChoiceList: Work with NASIS Choice Lists

### Description
Create (ordered) factors and interchange between choice names, values and labels for lists of input vectors.

### Usage

```r
NASISChoiceList(
  x,
  colnames = names(x),
  what = "ColumnPhysicalName",
  choice = c("ChoiceName", "ChoiceValue", "ChoiceLabel"),
  obsolete = FALSE,
  factor = TRUE,
  droplevels = FALSE,
  ordered = TRUE,
  simplify = TRUE,
  dsn = NULL
)
```

### Arguments

- **x**: A named list of vectors to use as input for NASIS Choice List lookup
- **colnames**: vector of values of the column specified by `what`. E.g. `colnames="texcl"` for `what="ColumnPhysicalName"`. Default: `names(x)` (if `x` is named)
- **what**: passed to `get_NASIS_column_metadata()`; Column to match `x` against. Default: "ColumnPhysicalName"; alternate options include "DomainID", "DomainName", "DomainRanked", "DisplayLabel", "ChoiceSequence", "ChoiceValue", "ChoiceName", "ChoiceLabel", "ChoiceObsolete", "ChoiceDescription", "ColumnLogicalName"
- **choice**: one of: "ChoiceName", "ChoiceValue", or "ChoiceLabel"
- **obsolete**: Include "obsolete" choices? Default: FALSE
- **factor**: Convert result to factor? Default: TRUE
- **droplevels**: Drop unused factor levels? Default: TRUE (used only when `factor=TRUE`)
- **ordered**: Should the result be an ordered factor? Default: TRUE (use only if DomainRanked is true for all choices)
- **simplify**: Should list result with length 1 be reduced to a single vector? Default: TRUE
- **dsn**: Optional: path to local SQLite database containing NASIS table structure; default: NULL
Value

A list of "choices" based on the input x that have been converted to a consistent target set of levels (specified by choice) via NASIS 7 metadata.

When factor=TRUE the result is a factor, possibly ordered when ordered=TRUE and the target domain is a "ranked" domain (i.e. ChoiceSequence has logical meaning).

When factor=FALSE the result is a character or numeric vector. Numeric vectors are always returned when choice is "ChoiceValue".

Examples

NASISChoiceList(1:3, "texcl")
NASISChoiceList(1:3, "pondfreqcl")
NASISChoiceList("Clay loam", "texcl", choice = "ChoiceValue")
NASISChoiceList("Silty clay loam", "texcl", choice = "ChoiceName")

---

NASISDomainsAsFactor  Get/Set Options for Encoding NASIS Domains as Factors

Description

Set package option soilDB.NASIS.DomainsAsFactor for returning coded NASIS domains as factors.

Usage

NASISDomainsAsFactor(x = NULL)

Arguments

x logical; default FALSE

Value

logical, result of getOption("soilDB.NASIS.DomainsAsFactor")

Examples

## Not run:
NASISDomainsAsFactor(TRUE)

## End(Not run)
NASIS_table_column_keys

NASIS 7 Tables, Columns and Foreign Keys

Description

This dataset contains NASIS 7 Tables, Columns and Foreign Keys

OSDquery

Search full text of Official Series Description on SoilWeb

Description

This is the R interface to OSD search by Section and OSD Search APIs provided by SoilWeb. OSD records are searched with the PostgreSQL fulltext indexing and query system (syntax details). Each search field (except for the "brief narrative" and MLRA) corresponds with a section header in an OSD. The results may not include every OSD due to formatting errors and typos. Results are scored based on the number of times search terms match words in associated sections.

Usage

OSDquery(
  everything = NULL,
  mlra = "",
  taxonomic_class = "",
  typical_pedon = "",
  brief_narrative = "",
  ric = "",
  use_and_veg = "",
  competing_series = "",
  geog_location = "",
  geog_assoc_soils = ""
)

Arguments

everything search entire OSD text (default is NULL), mlra may also be specified, all other arguments are ignored
mlra a comma-delimited string of MLRA to search ('17,18,22A')
taxonomic_class search family level classification
typical_pedon search typical pedon section
brief_narrative search brief narrative
ric search range in characteristics section

use_and_veg search use and vegetation section

competing_series search competing series section

gelog_location search geographic setting section

gelog_assoc_soils search geographically associated soils section

Details

See this webpage for more information.

- family level taxa are derived from SC database, not parsed OSD records
- MLRA are derived via spatial intersection (SSURGO x MLRA polygons)
- MLRA-filtering is only possible for series used in the current SSURGO snapshot (component name)
- logical AND: &
- logical OR: |
- wildcard, e.g. rhy-something rhy:*
- search terms with spaces need doubled single quotes: "san joaquin"
- combine search terms into a single expression: (grano:* | granite)

Related documentation can be found in the following tutorials

- overview of all soil series query functions
- competing soil series
- siblings

Value

a data.frame object containing soil series names that match patterns supplied as arguments.

Note

SoilWeb maintains a snapshot of the Official Series Description data.

Author(s)

D.E. Beaudette

References

fetchOSD, siblings, fetchOSD
Examples

```r
if(requireNamespace("curl") &
   curl::has_internet() &
   require(aqp)) {

  # find all series that list Pardee as a geographically associated soil.
  s <- OSDquery(geog_assoc_soils = 'pardee')

  # get data for these series
  x <- fetchOSD(s$series, extended = TRUE, colorState = 'dry')

  # simple figure
  par(mar=c(0,0,1,1))
  plot(x$SPC)
}
```

parseWebReport

Parse contents of a web report, based on supplied arguments.

Description

Parse contents of a web report, based on supplied arguments.

Usage

`parseWebReport(url, args, index = 1)`

Arguments

- `url` Base URL to a LIMS/NASIS web report.
- `args` List of named arguments to send to report, see details.
- `index` Integer index specifying the table to return, or, NULL for a list of tables

Details

Report argument names can be inferred by inspection of the HTML source associated with any given web report.

Value

A `data.frame` object in the case of a single integer passed to `index`, a `list` object in the case of an integer vector or NULL passed to `index`. 
**processSDA_WKT**

**Note**

Most web reports are for internal use only.

**Author(s)**

D.E. Beaudette and S.M. Roecker

**Examples**

```r
# pending
```

---

**processSDA_WKT**  
*Post-process Well-Known Text from Soil Data Access*

**Description**

This is a helper function commonly used with SDA_query to extract WKT (well-known text) representation of geometry to an sf or sp object.

**Usage**

```r
processSDA_WKT(d, g = "geom", crs = 4326, p4s = NULL, as_sf = TRUE)
```

**Arguments**

- `d` data.frame returned by SDA_query, containing WKT representation of geometry
- `g` name of column in d containing WKT geometry
- `crs` CRS definition (e.g. an EPSG code). Default 4326 for WGS84 Geographic Coordinate System
- `p4s` Deprecated: PROJ4 CRS definition
- `as_sf` Return an sf data.frame? If FALSE return a Spatial* object.

**Details**

The SDA website can be found at [https://sdmdataaccess.nrcs.usda.gov](https://sdmdataaccess.nrcs.usda.gov). See the SDA Tutorial for detailed examples.

The SDA website can be found at [https://sdmdataaccess.nrcs.usda.gov](https://sdmdataaccess.nrcs.usda.gov). See the SDA Tutorial for detailed examples.

**Value**

An sf object or if as_sf is FALSE a Spatial* object.
**Note**

This function requires the sf package.

**Author(s)**

D.E. Beaudette, A.G. Brown

---

**Description**

A simple interface to the ROSETTA model for predicting hydraulic parameters from soil properties. The ROSETTA API was developed by Dr. Todd Skaggs (USDA-ARS) and links to the work of Zhang and Schaap, (2017). See the related tutorial for additional examples.

**Usage**

```r
ROSETTA(
  x,
  vars,
  v = c("1", "2", "3"),
  include.sd = FALSE,
  chunkSize = 10000,
  conf = NULL
)
```

**Arguments**

- **x**
  a data.frame of required soil properties, may contain other columns, see details
- **vars**
  character vector of column names in x containing relevant soil property values, see details
- **v**
  ROSETTA model version number: '1', '2', or '3', see details and references.
- **include.sd**
  logical, include bootstrap standard deviation for estimated parameters
- **chunkSize**
  number of records per API call
- **conf**
  configuration passed to `httr::POST()` such as `verbose()`.

**Details**

Soil properties supplied in `x` must be described, in order, via `vars` argument. The API does not use the names but column ordering must follow: sand, silt, clay, bulk density, volumetric water content at 33kPa (1/3 bar), and volumetric water content at 1500kPa (15 bar).

The ROSETTA model relies on a minimum of 3 soil properties, with increasing (expected) accuracy as additional properties are included:

- required, sand, silt, clay: USDA soil texture separates (percentages) that sum to 100\%
- optional, bulk density (any moisture basis): mass per volume after accounting for >2mm fragments, units of gm/cm^3
- optional, volumetric water content at 33 kPa: roughly "field capacity" for most soils, units of cm^3/cm^3
- optional, volumetric water content at 1500 kPa: roughly "permanent wilting point" for most plants, units of cm^3/cm^3

The Rosetta pedotransfer function predicts five parameters for the van Genuchten model of unsaturated soil hydraulic properties

- \( \theta_r \) : residual volumetric water content
- \( \theta_s \) : saturated volumetric water content
- \( \log_{10}(\alpha) \) : retention shape parameter \([\log_{10}(1/cm)]\)
- \( \log_{10}(n_{par}) \) : retention shape parameter
- \( \log_{10}(k_{sat}) \) : saturated hydraulic conductivity \([\log_{10}(cm/d)]\)

Column names not specified in \texttt{vars} are retained in the output.

Three versions of the ROSETTA model are available, selected using \( v = 1, v = 2, \) or \( v = 3 \).

Author(s)

D.E. Beaudette, Todd Skaggs (ARS), Richard Reid

References

Consider using the interactive version, with copy/paste functionality at: \url{https://www.hanbook60.org/rosetta}.

Python ROSETTA model: \url{http://www.u.arizona.edu/~ygzhang/download.html}.

These data have been compiled from several sources and represent a progressive effort to organize SCAN/SNOTEL station metadata. Therefore, some records may be missing or incorrect.

**Format**

A data frame with 1092 observations on the following 12 variables.

- `list("Name")` station name
- `list("Site")` station ID
- `list("State")` state
- `list("Network")` sensor network: SCAN / SNOTEL
list("County")  county
list("Elevation_ft")  station elevation in feet
list("Latitude")  latitude of station
list("Longitude")  longitude of station
list("HUC")  associated watershed
list("climstanm")  climate station name (TODO: remove this column)
list("upedonid")  associated user pedon ID
list("pedlabsampnum")  associated lab sample ID

**SDA_query**  
*Query Soil Data Access*

**Description**

Submit a query to the Soil Data Access (SDA) REST/JSON web-service and return the results as a data.frame. There is a 100,000 record limit and 32Mb JSON serializer limit, per query. Queries should contain a WHERE statement or JOIN condition to limit the number of rows affected / returned. Consider wrapping calls to SDA_query in a function that can iterate over logical chunks (e.g. areasymbol, mukey, cokey, etc.). The function makeChunks can help with such iteration.

**Usage**

```r
SDA_query(q)
```

**Arguments**

- `q`  
A valid T-SQL query surrounded by double quotes

**Details**

SSURGO (detailed soil survey) and STATSGO (generalized soil survey) data are stored together within SDA. This means that queries that don’t specify an area symbol may result in a mixture of SSURGO and STATSGO records. See the examples below and the SDA Tutorial for details.

**Value**

- a data.frame result (NULL if empty, try-error on error)

**Note**

This function requires the `httr`, `jsonlite`, and `xml2` packages.

)
x <- SDA_query(q)
str(x)
}

SDA_spatialQuery  

Query Soil Data Access by spatial intersection with supplied geometry

Description

Query SDA (SSURGO / STATSGO) records via spatial intersection with supplied geometries. Input can be SpatialPoints, SpatialLines, or SpatialPolygons objects with a valid CRS. Map unit keys, overlapping polygons, or the spatial intersection of geom + SSURGO / STATSGO polygons can be returned. See details.

Usage

SDA_spatialQuery(

geom,
what = "mukey",
geomIntersection = FALSE,
db = c("SSURGO", "STATSGO", "SAPOLYGON"),
byFeature = FALSE,
idcol = "gid",
query_string = FALSE,
as_Spatial = getOption("soilDB.return_Spatial", default = FALSE)
)

Arguments

- **geom**: an sf or Spatial* object, with valid CRS. May contain multiple features.
- **what**: a character vector specifying what to return. 'mukey': data.frame with intersecting map unit keys and names, 'mupolygon' overlapping or intersecting map unit polygons from selected database, 'areasymbol': data.frame with intersecting soil survey areas, 'sapolygon': overlapping or intersecting soil survey area polygons (SSURGO only)
- **geomIntersection**: logical; FALSE: overlapping map unit polygons returned, TRUE: intersection of geom + map unit polygons is returned.
- **db**: a character vector identifying the Soil Geographic Databases ("SSURGO" or "STATSGO") to query. Option STATSGO works with what = "mukey" and what = "mupolygon".
- **byFeature**: Iterate over features, returning a combined data.frame where each feature is uniquely identified by value in idcol. Default FALSE.
idcol
Unique IDs used for individual features when byFeature = TRUE; Default "gid"

query_string
Default: FALSE; if TRUE return a character string containing query that would be sent to SDA via SDA_query

as_Spatial
Return sp classes? e.g. Spatial*DataFrame. Default: FALSE.

Details
Queries for map unit keys are always more efficient vs. queries for overlapping or intersecting (i.e. least efficient) features. geom is converted to GCS / WGS84 as needed. Map unit keys are always returned when using what = "mupolygon".

SSURGO (detailed soil survey, typically 1:24,000 scale) and STATSGO (generalized soil survey, 1:250,000 scale) data are stored together within SDA. This means that queries that don’t specify an area symbol may result in a mixture of SSURGO and STATSGO records. See the examples below and the SDA Tutorial for details.

Value
A data.frame if what = 'mukey', otherwise an sf object. A try-error in the event the request cannot be made or if there is an error in the query.

Note
Row-order is not preserved across features in geom and returned object. Use byFeature argument to iterate over features and return results that are 1:1 with the inputs. Polygon area in acres is computed server-side when what = 'mupolygon' and geomIntersection = TRUE.

seriesExtent

Retrieve Soil Series Extent Maps from SoilWeb

Description

This function downloads a generalized representations of a soil series extent from SoilWeb, derived from the current SSURGO snapshot. Data can be returned as vector outlines (sf object) or gridded representation of area proportion falling within 800m cells (SpatRaster object). Gridded series extent data are only available in CONUS. Vector representations are returned with a GCS/WGS84 coordinate reference system and raster representations are returned with an Albers Equal Area / NAD83 coordinate reference system (EPSG: 5070).

Usage

seriesExtent(
  s,
  type = c("vector", "raster"),
  timeout = 60,
  as_Spatial = getOption("soilDB.return_Spatial", default = FALSE)
)

Arguments

s a soil series name, case-insensitive
type series extent representation, 'vector': results in an sf object and 'raster' results in a SpatRaster object
timeout time that we are willing to wait for a response, in secondsas_Spatial Return sp (SpatialPolygonsDataFrame) / raster (RasterLayer) classes? Default: FALSE.

Value

An R spatial object, class depending on type and as_Spatial arguments
**seriesExtent**

```r
if(requireNamespace("curl") &
   requireNamespace("sf") &
   requireNamespace("terra") &
   curl::has_internet()) {

  # required packages
  library(sf)
  library(terra)

  # specify a soil series name
  s <- 'magnor'

  # return an sf object
  x <- seriesExtent(s, type = 'vector')

  # return a terra SpatRasters
  y <- seriesExtent(s, type = 'raster')

  if (!is.null(x) && !is.null(y)) {
    # note that CRS are different
    sf::st_crs(x)
    terra::crs(y)

    # transform vector representation to CRS of raster
    x <- sf::st_transform(x, terra::crs(y))

    # graphical comparison
    par(mar = c(1, 1, 1, 3))
    plot(y, axes = FALSE)
    plot(x["series"], add = TRUE, col = NA)
  }
}
```
Get "siblings" and "cousins" for a given soil series

Description

Look up siblings and cousins for a given soil series from the current fiscal year SSURGO snapshot via SoilWeb.

The siblings of any given soil series are defined as those soil components (major and minor) that share a parent map unit with the named series (as a major component). Component names are filtered using a snapshot of the Soil Classification database to ensure that only valid soil series names are included. Cousins are siblings of siblings. Data are sourced from SoilWeb which maintains a copy of the current SSURGO snapshot. Visualizations of soil "siblings"-related concepts can be found in the "Sibling Summary" tab of Soil Data Explorer app: https://casoilresource.lawr.ucdavis.edu/sde/.

Additional resources:
- Soil Series Query Functions
- Soil "Siblings" Tutorial
- SSSA 2019 Presentation - Mapping Soilscapes Using Soil Co-Occurrence Networks

Usage

siblings(s, only.major = FALSE, component.data = FALSE, cousins = FALSE)

Arguments

s character vector, the name of a single soil series, case-insensitive.
only.major logical, should only return siblings that are major components
component.data logical, should component data for siblings (and optionally cousins) be returned?
cousins logical, should siblings-of-siblings (cousins) be returned?

Value

A list containing:

- sib: data.frame containing siblings, major component flag, and number of co-occurrences
- sib.data: data.frame containing sibling component data (only when component.data = TRUE)
- cousins: data.frame containing cousins, major component flag, and number of co-occurrences (only when cousins = TRUE)
- cousin.data: data.frame containing cousin component data (only when cousins = TRUE, component.data = TRUE)

simplifyColorData

Simplify Color Data by ID

Description

Simplify multiple Munsell color observations associated with each horizon.

Usage

simplifyColorData(d, id.var = "phiid", wt = "colorpct", bt = FALSE)

Arguments

d  a data.frame object, typically returned from NASIS, see details

id.var  character vector with the name of the column containing an ID that is unique among all horizons in d

wt  a character vector with the name of the column containing color weights for mixing

bt  logical, should the mixed sRGB representation of soil color be transformed to closest Munsell chips? This is performed by aqp::rgb2Munsell aqp::rgb2Munsell

References

See Also

OSDquery, siblings, fetchOSD

Examples

if(requireNamespace("curl") &
   curl::has_internet()) {

    # basic usage
    x <- siblings('zook')
    x$sib

    # restrict to siblings that are major components
    # e.g. the most likely siblings
    x <- siblings('zook', only.major = TRUE)
    x$sib

}
Details
This function is mainly intended for the processing of NASIS pedon/horizon data which may or may not contain multiple colors per horizon/moisture status combination. simplifyColorData will "mix" multiple colors associated with horizons in d, according to IDs specified by id.var, using "weights" (area percentages) specified by the wt argument to mix_and_clean_colors.

Note that this function doesn't actually simulate the mixture of pigments on a surface, rather, "mixing" is approximated via weighted average in the CIELAB colorspace.

The simplifyColorData function can be applied to data sources other than NASIS by careful use of the id.var and wt arguments. However, d must contain Munsell colors split into columns named "colorhue", "colorvalue", and "colorchroma". In addition, the moisture state ("Dry" or "Moist") must be specified in a column named "colormoistst".

The mix_and_clean_colors function can be applied to arbitrary data sources as long as x contains sRGB coordinates in columns named "r", "g", and "b". This function should be applied to chunks of rows within which color mixtures make sense.

simplifyFragmentData
Simplify Coarse Fraction Data

Description
Simplify multiple coarse fraction (>2mm) records by horizon.

Usage
simplifyFragmentData(
    rf,
    id.var,
    vol.var = "fragvol",
    prefix = "frag",
    nullFragsAreZero = TRUE,
    msg = "rock fragment volume",
    ...
)

simplifyArtifactData(
    art,
    id.var,
simplifyFragmentData

```r
vol.var = "huartvol",
nullFrgsAreZero = nullFrgsAreZero,
... )
```

**Arguments**

- `rf` a `data.frame` object, typically returned from NASIS, see details
- `id.var` character vector with the name of the column containing an ID that is unique among all horizons in `rf`
- `vol.var` character vector with the name of the column containing the coarse fragment volume. Default "fragvol" or "huartvol".
- `prefix` a character vector prefix for input
- `nullFrgsAreZero` should fragment volumes of NULL be interpreted as 0? (default: `TRUE`), see details
- `msg` Identifier of data being summarized. Default is "rock fragment volume" but this routine is also used for "surface fragment cover"
- `...` Additional arguments passed to sieving function (e.g. sieves a named numeric containing sieve size thresholds with class name)
- `art` a `data.frame` object, typically returned from NASIS, see details

**Details**

This function is mainly intended for processing of NASIS pedon/component data which contains multiple coarse fragment descriptions per horizon. `simplifyFragmentData` will "sieve out" coarse fragments into the USDA classes, split into hard and para-fragments. Likewise, `simplifyArtifactData` will sieve out human artifacts, and split total volume into "cohesive", "penetrable", "innocuous", and "persistent".

These functions can be applied to data sources other than NASIS by careful use of the `id.var` and `vol.var` arguments.

- `rf` must contain rock or other fragment volumes in the column "fragvol" (or be specified with `vol.var`), fragment size (mm) in columns "fragsize_l", "fragsize_r", "fragsize_h", fragment cementation class in "fraghard" and flat/non-flat in "fragshp".
- `art` must contain artifact volumes in the column "huartvol" (or be specified with `vol.var`), fragment size (mm) in columns "huartsize_l", "huartsize_r", "huartsize_h", artifact cementation class in "huarthard" and flat/non-flat in "huartshp".

**Examples:**

- **KSSL data**

D.E. Beaudette, A.G Brown
soilColor.wcs

Get 30m or 270m gridded soil soil color data from SoilWeb Web Coverage Service (WCS)

Description

Moist soil colors, 2022.

Usage

soilColor.wcs(aoi, var, res = 270, quiet = FALSE)

Arguments

- **aoi**: area of interest (AOI) defined using a Spatial*, RasterLayer, sf, sfc or bbox object, OR a list, see details
- **var**: soil color grid name (case insensitive), see details
- **res**: grid resolution, units of meters, typically '270', or '30', depending on var. See details.
- **quiet**: logical, passed to curl::curl_download to enable / suppress URL and progress bar for download.

Details

aoi should be specified as a SpatRaster, Spatial*, RasterLayer, SpatRaster/SpatVector, sf, sfc, or bbox object or a list containing:

- **aoi** bounding-box specified as (xmin, ymin, xmax, ymax) e.g. c(-114.16, 47.65, -114.08, 47.68)
- **crs** coordinate reference system of BBOX, e.g. 'OGC:CRS84' (EPSG:4326, WGS84 Longitude/Latitude)

The WCS query is parameterized using a rectangular extent derived from the above AOI specification, after conversion to the native CRS (EPSG:5070) of the soil color grids.

Variables available from this WCS can be queried using WCS_details(wcs = 'soilColor'). The full resolution version of the soil color grids use a hr suffix, e.g. 'sc025cm_hr'.

Value

A SpatRaster (or RasterLayer) object containing indexed map unit keys and associated raster attribute table or a try-error if request fails. By default, spatial classes from the terra package are returned. If the input object class is from the raster or sp packages a RasterLayer is returned.

Author(s)

D.E. Beaudette and A.G. Brown
Examples

```r
## Not run:
library(terra)

# see WCS_details() for variable options
WCS_details(wcs = 'soilColor')

# moist soil color at 25cm, 270m version
res <- soilColor.wcs(list(aoi = c(-116, 35, -115.5, 35.5), crs = "EPSG:4326"),
                      var = 'soilColor', res = 270)

# note colors and other metadata are stored
# in raster attribute table
plot(res, col = cats(res)[[1]]$col, axes = FALSE, legend = FALSE)

## End(Not run)
```

SoilWeb_spatial_query  Get SSURGO Data via Spatial Query

Description

Get SSURGO Data via Spatial Query to SoilWeb

Usage

```r
SoilWeb_spatial_query(
    bbox = NULL,
    coords = NULL,
    what = "mapunit",
    source = "soilweb"
)
```

Arguments

- **bbox**: a bounding box in WGS84 geographic coordinates, see examples
- **coords**: a coordinate pair in WGS84 geographic coordinates, see examples
- **what**: data to query, currently ignored
- **source**: the data source, currently ignored

Details

Data are currently available from SoilWeb. These data are a snapshot of the "official" data. The snapshot date is encoded in the "soilweb_last_update" column in the function return value. Planned updates to this function will include a switch to determine the data source: "official" data via USDA-NRCS servers, or a "snapshot" via SoilWeb.
Value

The data returned from this function will depend on the query style. See examples below.

Note

SDA now supports spatial queries, consider using `SDA_spatialQuery` instead.

Author(s)

D.E. Beaudette

Examples

```r
if(requireNamespace("curl") &
   curl::has_internet()) {

   # query by bbox
   SoilWeb_spatial_query(bbox=c(-122.05, 37, -122, 37.05))

   # query by coordinate pair
   SoilWeb_spatial_query(coords=c(-121, 38))
}
```

---

STRplot

Graphical Description of US Soil Taxonomy Soil Temperature Regimes

Description

Graphical Description of US Soil Taxonomy Soil Temperature Regimes

Usage

```r
STRplot(mast, msst, mwst, permafrost = FALSE, pt.cex = 2.75, leg.cex = 0.85)
```

Arguments

- `mast`: single value or vector of mean annual soil temperature (deg C)
- `msst`: single value or vector of mean summer soil temperature (deg C)
- `mwst`: single value of mean winter soil temperature (deg C)
- `permafrost`: logical: permafrost presence / absence
- `pt.cex`: symbol size
- `leg.cex`: legend size
summarizeSoilTemperature

STRplot(mast = 0:25, msst = 10, mwst = 1)
```

summarizeSoilTemperature

Get data from Henry Mount Soil Temperature and Water Database

Description

This function is a front-end to the REST query functionality of the Henry Mount Soil Temperature and Water Database.

Usage

```r
summarizeSoilTemperature(soiltemp.data)
```

```r
calclab()$soiltemp.summaries = TRUE,
tz = ""
)```
**Arguments**

- `soiltemp.data`: A data.frame containing soil temperature data
- `x`: character vector containing month abbreviation e.g. c('Jun', 'Dec', 'Sep')
- `what`: type of data to return: 'sensors': sensor metadata only | 'soiltemp': sensor metadata + soil temperature data | 'soilVWC': sensor metadata + soil moisture data | 'airtemp': sensor metadata + air temperature data | 'waterlevel': sensor metadata + water level data | 'all': sensor metadata + all sensor data
- `usersiteid`: (optional) filter results using a NASIS user site ID
- `project`: (optional) filter results using a project ID
- `sso`: (optional) filter results using a soil survey office code
- `gran`: data granularity: "hour" (if available), "day", "week", "month", "year"; returned data are averages
- `start.date`: (optional) starting date filter
- `stop.date`: (optional) ending date filter
- `pad.missing.days`: should missing data ("day" granularity) be filled with NA? see details
- `soiltemp.summaries`: should soil temperature ("day" granularity only) be summarized? see details
- `tz`: Used for custom timezone. Default "" is current locale

**Details**

Filling missing days with NA is useful for computing and index of how complete the data are, and for estimating (mostly) unbiased MAST and seasonal mean soil temperatures. Summaries are computed by first averaging over Julian day, then averaging over all days of the year (MAST) or just those days that occur within "summer" or "winter". This approach makes it possible to estimate summaries in the presence of missing data. The quality of summaries should be weighted by the number of "functional years" (number of years with non-missing data after combining data by Julian day) and "complete years" (number of years of data with >= 365 days of non-missing data).

See:

- Henry Mount Soil Climate Database
- fetchHenry Tutorial

**Value**

a list containing:

- `sensors`: a sf data.frame object containing site-level information
- `soiltemp`: a data.frame object containing soil temperature timeseries data
- `soilVWC`: a data.frame object containing soil moisture timeseries data
- `airtemp`: a data.frame object containing air temperature timeseries data
- `waterlevel`: a data.frame object containing water level timeseries data
Note

This function and the back-end database are very much a work in progress.

taxaExtent  Get SoilWeb 800m Major Component Soil Taxonomy Grids

description

This function downloads a generalized representation of the geographic extent of any single taxon from the top 4 levels of Soil Taxonomy, or taxa matching a given formative element used in Great Group or subgroup taxa. Data are provided by SoilWeb, ultimately sourced from the current SSURGO snapshot. Data are returned as raster objects representing area proportion falling within 800m cells. Currently area proportions are based on major components only. Data are only available in CONUS and returned using an Albers Equal Area / NAD83(2011) coordinate reference system (EPSG: 5070).

Usage

taxaExtent(
  x,
  level = c("order", "suborder", "greatgroup", "subgroup"),
  formativeElement = FALSE,
  timeout = 60,
  as_Spatial = getOption("soilDB.return_Spatial", default = FALSE)
)

Arguments

x single taxon label (e.g. haploxeralfs) or formative element (e.g. pale), case-insensitive
level the taxonomic level within the top 4 tiers of Soil Taxonomy, one of 'order', 'suborder', 'greatgroup', 'subgroup'
formativeElement logical, search using formative elements instead of taxon label
timeout time that we are willing to wait for a response, in seconds
as_Spatial Return raster (RasterLayer) classes? Default: FALSE.
Details

See the Geographic Extent of Soil Taxa tutorial for more detailed examples.

Taxon Queries:
Taxon labels can be conveniently extracted from the "ST_unique_list" sample data, provided by the SoilTaxonomy package.

Formative Element Queries:

Greatgroup::
The following labels are used to access taxa containing the following formative elements (in parentheses)

- acr: (acro/acr) extreme weathering
- alb: (alb) presence of an albic horizon
- anhy: (anhy) very dry
- anthra: (anthra) presence of an anthropic epipedon
- aqu: (aqui/aqu) wetness
- argi: (argi) presence of an argillic horizon
- calci: (calci) presence of a calcic horizon
- cry: (cryo/cry) cryic STR
- dur: (duri/dur) presence of a duripan
- dystr: (dystro/dystr) low base saturation
- endo: (endo) ground water table
- epi: (epi) perched water table
- eutr: (euro/eutr) high base saturation
- ferr: (ferr) presence of Fe
- fibr: (fibr) least decomposed stage
- fluv: (fluv) flood plain
- fol: (fol) mass of leaves
- fragi: (fragi) presence of a fragipan
- fragloss: (fragloss) presence of a fragipan and glossic horizon
- frasi: (frasi) not salty
- fulv: (fulvi/fulv) dark brown with organic carbon
- glac: (glac) presence of ice lenses
- gloss: (glosso/gloss) presence of a glossic horizon
- gypsi: (gypsi) presence of a gypsic horizon
- hal: (hal) salty
- hemi: (hemi) intermediate decomposition
- hist: (histo/hist) organic soil material
- hum: (humi/hum) presence of organic carbon
- hydr: (hydro/hydr) presence of water
- kandi: (kandi) presence of a kandic horizon
- kanhap: (kanhaplo/kanhap) thin kandic horizon
- luvi: (luvi) illuvial organic material
• melan: (melano/melan) presence of a melanic epipedon
• moll: (molli/moll) presence of a mollic epipedon
• natr: (natri/natr) presence of a natic horizon
• pale: (pale) excessive development
• petr: (petro/petr) petrocalcic horizon
• plac: (plac) presence of a thin pan
• plagg: (plagg) presence of a plaggen epipedon
• plinth: (plinth) presence of plinthite
• psamm: (psammo/psammi) sandy texture
• quartzi: (quartzi) high quartz content
• rhod: (rhodo/rhod) dark red colors
• sal: (sali/sal) presence of a salic horizon
• sapr: (sapr) most decomposed stage
• sombri: (sombri) presence of a sombric horizon
• sphagno: (sphagno) presence of sphagnum moss
• sulf: (sulfo/sulfi/sulf) presence of sulfides or their oxidation products
• torri: (torri) torric/aridic SMR
• ud: (udi/ud) udic SMR
• umbr: (umbri/umbr) presence of an umbric epipedon
• ust: (usti/ust) ustic SMR
• verm: (verm) wormy, or mixed by animals
• vitr: (vitr/vitr) presence of glass
• xer: (xero/xer) xeric SMR

Subgroup::
The following labels are used to access taxa containing the following formative elements (in parenthesis).
• abruptic: (abruptic) abrupt textural change
• acric: (acric) low apparent CEC
• aeric: (aeric) more aeration than typic subgroup
• albaquic: (albaquic) presence of albic minerals, wetter than typic subgroup
• albic: (albic) presence of an argillic or kandic horizon
• alic: (alic) high extractable Al content
• anionic: (anionic) low CEC or positively charged
• anthraquic: (anthraquic) human controlled flooding as in paddy rice culture
• anthropic: (anthropic) an anthropic epipedon
• aquic: (aquic) wetter than typic subgroup
• arenic: (arenic) 50-100cm sandy textured surface
• argic: (argic) argillic horizon
• aridic: (aridic) more aridic than typic subgroup
• calcic: (calcic) presence of a calcic horizon
• chromic: (chromic) high chroma colors
• cumulic: (cumulic) thickened epipedon
• duric: (duric) presence of a duripan
• durinodic: (durinodic) presence of durinodes
• dystric: (dystric) lower base saturation percentage
• entic: (entic) minimal surface/subsurface development
• eutric: (eutric) higher base saturation percentage
• fibric: (fibric) >25cm of fibric material
• fluvaquentic: (fluvaquentic) wetter than typic subgroup, evidence of stratification
• fragiaquic: (fragiaquic) presence of fragic properties, wetter than typic subgroup
• fragic: (fragic) presence of fragic properties
• glacic: (glacic) presence of ice lenses or wedges
• glossaquic: (glossaquic) interfingered horizon boundaries, wetter than typic subgroup
• glossic: (glossic) interfingered horizon boundaries
• grossarenic: (grossarenic) >100cm sandy textured surface
• gypsic: (gypsic) presence of gypsic horizon
• halic: (halic) salty
• haplic: (haplic) central theme of subgroup concept
• hemic: (hemic) >25cm of hemic organic material
• humic: (humic) higher organic matter content
• hydric: (hydric) presence of water
• kandic: (kandic) low activity clay present
• lamellic: (lamellic) presence of lamellae
• leptic: (leptic) thinner than typic subgroup
• limnic: (limnic) presence of a limnic layer
• lithic: (lithic) shallow lithic contact present
• natric: (natric) presence of sodium
• nitric: (nitric) presence of nitrate salts
• ombroaquic: (ombroaquic) surface wetness
• oxyaquic: (oxyaquic) water saturated but not reduced
• pachic: (pachic) epipedon thicker than typic subgroup
• petrocalcic: (petrocalcic) presence of a petrocalcic horizon
• petroferric: (petroferric) presence of petroferric contact
• petrogypsic: (petrogypsic) presence of a petrogypsic horizon
• petronodic: (petronodic) presence of concretions and/or nodules
• placic: (placic) presence of a placic horizon
• plinthic: (plinthic) presence of plinthite
• rhodic: (rhodic) darker red colors than typic subgroup
• ruptic: (ruptic) intermittent horizon
• salic: (salic) presence of a salic horizon
• sapric: (sapric) >25cm of sapric organic material
• sodic: (sodic) high exchangeable Na content
• sombric: (sombric) presence of a sombric horizon
• sphagnic: (sphagnic) sphagnum organic material
• sulfic: (sulfic) presence of sulfides
• terric: (terric) mineral substratum within 1 meter
• thapto: (thaptic/thapto) presence of a buried soil horizon
• turbic: (turbic) evidence of cryoturbation
• udic: (udic) more humid than typic subgroup
• umbric: (umbric) presence of an umbric epipedon
• ustic: (ustic) more ustic than typic subgroup
• vermic: (vermic) animal mixed material
• vitric: (vitric) presence of glassy material
• xanthic: (xanthic) more yellow than typic subgroup
• xeric: (xeric) more xeric than typic subgroup

Value

a SpatRaster object (or RasterLayer when as_Spatial=TRUE)

Author(s)

D.E. Beaudette and A.G. Brown

Examples

```r
## Not run:
\donttest{
if(requireNamespace("curl") &
  requireNamespace("terra") &
  curl::has_internet()) {

library(terra)

# soil order
taxa <- 'vertisols'
x <- taxaExtent(taxa, level = 'order')

# suborder
taxa <- 'ustalfs'
x <- taxaExtent(taxa, level = 'suborder')

# greatgroup
taxa <- 'haplohumults'
x <- taxaExtent(taxa, level = 'greatgroup')

# subgroup
taxa <- 'Typic Haploxerepts'
x <- taxaExtent(taxa, level = 'subgroup')

# greatgroup formative element
taxa <- 'psamm'
```
x <- taxaExtent(taxa, level = 'greatgroup', formativeElement = TRUE)

# subgroup formative element
taxa <- 'abruptic'
x <- taxaExtent(taxa, level = 'subgroup', formativeElement = TRUE)

# coarsen for faster plotting
a <- terra::aggregate(x, fact = 5, na.rm = TRUE)

# quick evaluation of the result
terra::plot(a, axes = FALSE)

## End(Not run)

### Convert coded values returned from NASIS and SDA queries into human-readable values

**Description**

These functions convert the coded values returned from NASIS or SDA to factors (e.g. 1 = Alfisols) using the metadata tables from NASIS. For SDA the metadata is pulled from a static snapshot in the soilDB package (/data/metadata.rda).

**Usage**

```r
unbind(df, invert = FALSE, db = "NASIS", droplevels = FALSE, stringsAsFactors = NULL, dsn = NULL)

code(df, db = NULL, droplevels = FALSE, stringsAsFactors = NULL, dsn = NULL)
```

**Arguments**

- `df` data.frame
- `invert` converts the code labels back to their coded values (FALSE)
- `db` label specifying the soil database the data is coming from, which indicates whether or not to query metadata from local NASIS database ("NASIS") or use soilDB-local snapshot ("LIMS" or "SDA")
droplevels logical: indicating whether to drop unused levels in classifying factors. This is useful when a class has large number of unused classes, which can waste space in tables and figures.

stringsAsFactors deprecated

dsn Optional: path to local SQLite database containing NASIS table structure; default: NULL

Details

These functions convert the coded values returned from NASIS into their plain text representation. It duplicates the functionality of the CODELABEL function found in NASIS. This function is primarily intended to be used internally by other soilDB R functions, in order to minimize the need to manually convert values.

The function works by iterating through the column names in a data frame and looking up whether they match any of the ColumnPhysicalNames found in the metadata domain tables. If matches are found then the columns coded values are converted to their corresponding factor levels. Therefore it is not advisable to reuse column names from NASIS unless the contents match the range of values and format found in NASIS. Otherwise uncode() will convert their values to NA.

When data is being imported from NASIS, the metadata tables are sourced directly from NASIS. When data is being imported from SDA or the NASIS Web Reports, the metadata is pulled from a static snapshot in the soilDB package.

Set options(soilDB.NASIS.skip_uncode = TRUE) to bypass decoding logic; for instance when using soilDB NASIS functions with custom NASIS snapshots that have already been decoded.

Value

A data.frame with the results.

Author(s)

Stephen Roecker

Examples

# convert column name 'fraghard' (fragment hardness) codes to labels uncode(data.frame(fraghard = 1:10))

# convert column name 'fragshp' (fragment shape) labels to codes code(data.frame(fragshp = c("flat", "nonflat")))
### us_ss_timeline

**Timeline of US Published Soil Surveys**

**Description**

This dataset contains the years of each US Soil Survey was published.

**Format**

A data.frame with 5209 observations on the following 5 variables.

- "ssa": Soil Survey name, a character vector
- "year": Year of publication, a numeric vector
- "pdf": Does a manuscript PDF document exist? a logical vector
- "state": State abbreviation, a character vector

**Details**

This data was web scraped from the NRCS Soils Website. The scraping procedure and a example plot are included in the examples section below.

**Source**

---

### waterDayYear

**Compute Water Day and Year**

**Description**

Compute "water" day and year, based on the end of the typical or legal dry season. This is September 30 in California.

**Usage**

`waterDayYear(d, end = "09-30", format = "%Y-%m-%d", tz = "UTC")`

**Arguments**

- `d`: anything the can be safely converted to POSIXlt
- `end`: "MM-DD" notation for end of water year
- `format`: Used in POSIXlt conversion. Default "%Y-%m-%d"
- `tz`: Used in POSIXlt conversion for custom timezone. Default is "UTC"
WCS_details

Details
This function doesn’t know about leap-years. Probably worth checking.

Value
A data.frame object with the following

- wy the "water year"
- wd the "water day"

Author(s)
D.E. Beaudette

References

Examples

# try it
waterDayYear('2019-01-01')

WCS_details

Web Coverage Services Details

Description
List variables or databases provided by soilDB web coverage service (WCS) abstraction. These lists will be expanded in future versions.

Usage
WCS_details(wcs = c("mukey", "ISSR800", "soilColor"))

Arguments
wcs a WCS label (’mukey’, ’ISSR800’, or ’soilColor’)

Value
a data.frame

Examples

WCS_details(wcs = ’ISSR800’)
