Package ‘spam’

March 8, 2019

Type Package
Title SPArse Matrix
Version 2.2-2
Date 2019-03-07
Depends R (>= 3.1), dotCall64, grid, methods
Suggests spam64, fields, SparseM, Matrix, testthat, R.rsp, truncdist, knitr, rmarkdown
VignetteBuilder R.rsp, knitr
Description Set of functions for sparse matrix algebra.
   Differences with other sparse matrix packages are:
   (1) we only support (essentially) one sparse matrix format,
   (2) based on transparent and simple structure(s),
   (3) tailored for MCMC calculations within G(M)RF.
   (4) and it is fast and scalable (with the extension package spam64).
LazyData true

Description

spam is a collection of functions for sparse matrix algebra.

General overview

What is spam and what is it not:

While Matrix seems an overshoot of classes and SparseM focuses mainly on regression type problem, we provide a minimal set of sparse matrix functions fully functional for everyday spatial statistics life. There is however some emphasize on Markov chain Monte Carlo type calculations within the framework of (Gaussian) Markov random fields.
Emphasis is given on a comprehensive, simple, tutorial structure of the code. The code is S4 based but (in a tutorial spirit) the functions are in a S3 structure visible to the user (exported via \texttt{NAMESPACE}).

There exist many methods for sparse matrices that work identically as in the case of ordinary matrices. All the methods are discussed in the help and can be accessed directly via a \texttt{\*spam} concatenation to the function. For example, \texttt{help(chol.spam)} calls the help directly. We deliberately avoid aliases according to analogue helps from the base package.

Sparseness is used when handling large matrices. Hence, care has been used to provide efficient and fast routines. Essentially, the functions do not transform the sparse structure into full matrices to use standard (available) functionality, followed by a back transform. We agree, more operators, functions, etc. should eventually be implemented.

The packages \texttt{fields} and \texttt{spam} are closely linked.

**Author(s)**

Reinhard Furrer, with the help of Florian Gerber, Kaspar Moesinger and many others. Some Fortran routines were written by Youcef Saad, Esmond G. Ng, Barry W. Peyton, Joseph W.H. Liu, Alan D. George.

**References**

**See Also**

See \texttt{spam.class} for a detailed class description, \texttt{spam} and \texttt{spam.ops} for creation, coercion and algebraic operations.

**Examples**

```r
## Citations:
citation("spam")
citation("spam", auto=TRUE)

## History of changes
## Not run:
file.show(system.file("NEWS", package = "spam"))
```
adjacency

## Description

Constructing the adjacency graph of the administrative districts of Germany

## Usage

`adjacency.landkreis(loc)`

## Arguments

- `loc`: location of the graph structure, can be an URL.

## Details

The function is included as an example on how to construct adjacency matrices form a (common) adjacency structure. For the particular example, note that the nodes are not numbered consecutively and that they start from zero.

## Value

a sparse matrix in `spam` format.

## Author(s)

Reinhard Furrer

## References

The adjacency data has been provided by Havard Rue and is also available in `INLA`.

## See Also

- `germany.plot` super-seeding `map.landkreis` for plotting.
- `oral`

## Examples

```r
# Not run:
loc <- system.file("demodata/germany.adjacency", package="spam")
display(adjacency.landkreis(loc))
# Not run
```
allequal Test if Two 'spam' Objects are (Nearly) Equal

Description

Utility to compare two spam objects testing 'near equality'. Depending on the type of difference, comparison is still made to some extent, and a report of the differences is returned.

Usage

## S3 method for class 'spam'
allequal(target, current, tolerance = .Machine$double.eps*0.5,
scale = NULL, check.attributes = FALSE,...)

Arguments

target a spam object.
current another spam object to be compared with target.
tolerance numeric >= 0. Differences smaller than tolerance are not considered.
scale numeric scalar > 0 (or NULL). See ‘Details’.
check.attributes currently not yet implemented.
... Further arguments for different methods.

Details

Numerical comparisons for scale = NULL (the default) are done by first computing the mean absolute difference of the two numerical vectors. If this is smaller than tolerance or not finite, absolute differences are used, otherwise relative differences scaled by the mean absolute difference.

If scale is positive, absolute comparisons are made after scaling (dividing) by scale.

Do not use all.equal.spam directly in if expressions: either use isTRUE( all.equal.spam(...)) or identical if appropriate.

Cholesky decomposition routines use this function to test for symmetry.

A method for matrix-spam objects is defined as well.

There is the additional catch of a zero matrix being represented by one zero element, see ‘Examples’ below.

Value

Either TRUE or a vector of 'mode' "character" describing the differences between target and current.
apply

Author(s)
Reinhard Furrer

See Also

isSymmetric.spam and cleanup.

Examples

obj <- diag.spam(2)
obj[1,2] <- .Machine$double.eps

all.equal( diag.spam(2), obj)
all.equal( t(obj), obj)
all.equal( t(obj), obj*1.1)

# We can compare a spam to a matrix
all.equal(diag(2),diag.spam(2))

# the opposite does often not make sense,
# hence, it is not implemented.
all.equal(diag.spam(2),diag(2))

# A zero matrix contains one element:
str(spam(0))
# hence
all.equal.spam(spam(0,3,3), diag.spam(0,3) )
norm(spam(0,3,3) - diag.spam(0,3) )

---

apply Apply Functions Over Sparse Matrix Margins

Description

Returns a vector or array or list of values obtained by applying a function to margins of a sparse matrix.

Usage

apply.spam(X, MARGIN=NULL, FUN, ...)

---
**Arguments**

- **X** the spam matrix to be used.
- **MARGIN** a vector giving the subscripts which the function will be applied over. 1 indicates rows, 2 indicates columns, NULL or c(1, 2) indicates rows and columns.
- **FUN** the function to be applied.
- ... optional arguments to FUN.

**Details**

This is a handy wrapper to apply a function to the (nonzero) elements of a sparse matrix. For example, it is possible to apply a covariance matrix to a distance matrix obtained by nearest.dist, see Examples.

A call to apply only coerces the sparse matrix to a regular one.

The basic principle is applying the function to @entries, or to the extracted columns or rows ([,i,drop=F] or [i,,drop=F]). It is important to note that an empty column contains at least one zero value and may lead to non-intuitive results.

This function may evolve over the next few releases.

**Value**

Similar as a call to apply with a regular matrix. The most important cases are as follows. The result is a vector (MARGIN is length 1 and FUN is scalar) or a matrix (MARGIN is length 1 and FUN returns fixed length vectors, or MARGIN is length 2 and FUN is scalar) or a list (if FUN returns vectors of different lengths).

**Author(s)**

Reinhard Furrer

**See Also**

base:apply for more details on Value.

**Examples**

```r
S <- as.spam(dist(1:5))
S <- apply.spam(S/2, NULL, exp)
# instead of
# S@entries <- exp( S@entries/2)

# Technical detail, a null matrix consists
# of one zero element.
apply.spam(S,c(1,2),pmax)
apply.spam(S,1,range)
```
# A similar example as for the base apply.
# However, no dimnames else we would get warnings.
x <- as.spam(cbind(x1 = 3, x2 = c(0,0,0, 5:2)))
apply.spam(x, 2, mean, trim = .2)
col.sums <- apply.spam(x, 2, sum)
row.sums <- apply.spam(x, 1, sum)
rbind(cbind(x, row.sums), c(col.sums, sum(col.sums)))
apply.spam(x, 2, is.vector)

# Sort the columns of a matrix
# Notice that the result is a list due to the different
# lengths induced by the nonzero elements
apply.spam(x, 2, sort)

# Function with extra args:
cave <- function(x, c1, c2) c(mean(x[c1]), mean(x[c2]))
apply(x,1, cave, c1=1, c2=c(1,2))

ma <- spam(c(1:4, 0, 0, 0, 6), nrow = 2)
ma
apply.spam(ma, 1, table) #--> a list of length 2
apply.spam(ma, 1, stats::quantile)# 5 x n matrix with rownames

---

**bandwidth**  

**Bandwidth of a Sparse Matrix**

### Description

Returns the lower and upper bandwidth of a sparse matrix

### Usage

`bandwidth(A)`

### Arguments

- `A`  
  spam object

### Details

The matrix does not need to be diagonal. Values can be negative indicating the the matrix contains a band cinfined in the upper or lower triangular part.

### Value

Integer vector containing the lower and upper bandwidth
**bdiag**

**Binds Arrays Corner-to-Corner**

**Description**

Creates a sparse block-diagonal matrix.

**Usage**

`bdiag.spam(...)`

**Arguments**

`...`  Arrays to be binded together

**Details**

This is a small helper function to create block diagonal sparse matrices. In the two matrix case, `bdiag.spam(A,B)`, this is equivalent to a complicated `rbind(cbind(A, null), cbind(B, t(null)))`, where `null` is a null matrix of appropriate dimension.

It is recursively defined.

The arrays are coerced to sparse matrices first.

This function is similar to the function `bdiag` from the package Matrix. It is also similar to the function `adiag` from the package magic. However, here no padding is done and all the dimnames are stripped.

**Value**

Returns a spam matrix as described above.
cbind

Author(s)
Reinhard Furrer

See Also
diag.spam.

Examples

A <- diag.spam(2, 4)  # 2x4
B <- matrix(1, 3, 3)
AB <- bdiag.spam(A, B)

# equivalent to:
ABalt <- rbind(cbind( A, matrix(0, nrow(A), ncol(B))),
cbind( matrix(0, nrow(B), ncol(A)), B))
norm(AB-ABalt)

# Matrices do not need to be square:
bdiag.spam(1:2:5, 6)

---

**cbind**

*Combine spam Matrices by Rows or Columns*

Description

Take a sequence of vector, matrix or spam object arguments and combine by columns or rows, respectively.

Usage

# cbind(..., force64 =getOption("spam.force64"), deparse.level = 0)
# rbind(..., deparse.level = 0)

Arguments

... vectors, matrices or spam objects. See ‘Details’ and ‘Value’
force64 logical vector of length 1. If TRUE, a 64-bit spam matrix is returned in any case.
If FALSE, a 32-bit matrix is returned when possible.
deparse.level for compatibility reason here. Only 0 is implemented.
Details
rbind and cbind are not exactly symmetric in how the objects are processed. The former is essentially an concatenation of the slots due to the sparse storage format. Different types of inputs are handled differently. The latter calls a Fortran routine after the input has been coerced to spam objects.

Only two objects at a time are processed. If more than two are present, a loop concatenates them successively.

A method is defined for a spam object as first argument.

Value
a spam object combining the ... arguments column-wise or row-wise. (Exception: if there are no inputs or all the inputs are NULL, the value is NULL.)

Author(s)
Reinhard Furrer

Examples
x <- cbind.spam(1:5,6)
y <- cbind(x, 7)

rbind( x, x)
# for some large matrices t( cbind( t(x), t(x)))
# might be slightly faster:

---

chol

Cholesky Factorization for Sparse Matrices

Description
chol performs a Cholesky decomposition of a symmetric positive definite sparse matrix x of class spam.

Usage

# chol(x, ...)

## S4 method for signature 'spam'
chol(x, pivot = "MMD", method = "NgPeyton", memory = list(), eps = getOption("spam.eps"),...)
Arguments

- **x**: symmetric positive definite matrix of class `spam`.
- **pivot**: should the matrix be permuted, and if, with what algorithm, see ‘Details’ below.
- **method**: Currently, only `NgPeyton` is implemented.
- **memory**: Parameters specific to the method, see ‘Details’ below.
- **eps**: threshold to test symmetry. Defaults to `getOption("spam.eps")`.
- **...**: further arguments passed to or from other methods.
- **object**: an object from a previous call to `chol`.

Details

`chol` performs a Cholesky decomposition of a symmetric positive definite sparse matrix `x` of class `spam`. Currently, there is only the block sparse Cholesky algorithm of Ng and Peyton (1993) implemented (method="NgPeyton").

To pivot/permute the matrix, you can choose between the multiple minimum degree (pivot="MMD") or reverse Cuthill-McKee (pivot="RCM") from George and Lui (1981). It is also possible to furnish a specific permutation in which case `pivot` is a vector. For compatibility reasons, `pivot` can also take a logical in which for `FALSE` no permutation is done and for `TRUE` is equivalent to `mmd`.

Often the sparsity structure is fixed and does not change, but the entries do. In those cases, we can update the Cholesky factor with `update.spam.chol.NgPeyton` by supplying a Cholesky factor and the updated matrix. Notice that the structure is effectively `object <- update(object, x)`. The update feature without assignment has been disabled.

The option `cholupdate singular` determines how singular matrices are handled by `update`. The function hands back an error ("error"), a warning ("warning") or the value NULL ("null").

The Cholesky decompositions requires parameters, linked to memory allocation. If the default values are too small the Fortran routine returns an error to R, which allocates more space and calls the Fortran routine again. The user can also pass better estimates of the allocation sizes to `chol` with the argument `memory=list(nnzR=..., nnzcolindices=...)`. The minimal sizes for a fixed sparsity structure can be obtained from a summary call, see ‘Examples’.

The output of `chol` can be used with `forwardsolve` and `backsolve` to solve a system of linear equations.

Notice that the Cholesky factorization of the package `Sparsesm` is also based on the algorithm of Ng and Peyton (1993). Whereas the Cholesky routine of the package `Matrix` are based on `CHOLMOD` by Timothy A. Davis (C code).
Value

The function returns the Cholesky factor in an object of class spam.chol.method. Recall that the latter is the Cholesky factor of a reordered matrix x, see also ordering.

Note

Although the symmetric structure of x is needed, only the upper diagonal entries are used. By default, the code does check for symmetry (contrarily to base:::chol). However, depending on the matrix size, this is a time consuming test. A test is ignored if options("spam.cholsymmetrycheck") is set to FALSE.

If a permutation is supplied with pivot, options("spam.cholpivotcheck") determines if the permutation is tested for validity (defaults to TRUE).

Author(s)

Reinhard Furrer, based on Ng and Peyton (1993) Fortran routines

References

See Also

det.spam, solve.spam, forwardsolve.spam, backsolve.spam and ordering.

Examples

```r
# generate multivariate normals:
set.seed(13)
n <- 25  # dimension
N <- 1000  # sample size
Sigma <- .25 * abs(outer(1:n,1:n,"-"))
Sigma <- as.spam( Sigma, eps=1e-4)

cholS <- chol( Sigma)
# cholS is the upper triangular part of the permutated matrix Sigma
iord <- ordering(cholS, inv=TRUE)

R <- as.spam(cholS)
mvsample <- ( array(rnorm(N*n),c(N,n)) %*% R)[,iord]
# It is often better to order the sample than the matrix
# R itself.

# 'mvsample' is of class 'spam'. We need to transform it to a
# regular matrix, as there is no method 'var' for 'spam' (should there?).
```
Create Circulant Matrices

Description

Creates a circulant matrix in spam format.

Usage

```r
circulant.spam(x, n = NULL, eps = getOption("spam.eps"))
```

Arguments

- `x` the first row to form the circulant matrix or a list containing the indices and the nonzero values.
- `n` if `x` is a list, the dimension of the matrix.
- `eps` A tolerance parameter: elements of `x` such that `abs(x) <= eps` set to zero. Defaults to `eps = getOption("spam.eps")`.

Value

The circulant matrix in spam format.

Author(s)

Reinhard Furrer

See Also

- `circulant` from package magic, `toeplitz.spam`

Examples

```r
circulant.spam(c(1,.25,0,0,0))
```
Description

Eliminates all zeros in a sparse matrix.

Usage

```r
cleanup(x, eps =getOption("spam.eps"))
```

Arguments

- `x`: a sparse matrix of class `spam`.
- `eps`: numeric scalar > 0. Smaller entries are coerced to zero.

Details

A sparse matrix may still contain zeros. This function (aliased to `as.spam`) filters these values. This often causes confusion when testing such matrices for symmetry or comparing apparently equal matrices with `all.equal` (see ‘Examples’ below).

Author(s)

Reinhard Furrer

See Also

`isSymmetric.spam` and `all.equal.spam`.

Examples

```r
A <- diag.spam(2)
A[1,2] <- 0

all.equal(A, t(A))
isSymmetric.spam(A)
all.equal(cleanup(A), diag.spam(2))
```
Description

These functions manage the relations that allow coercing a spam object to a given class.

Methods

signature(from = "spam", to = "matrix") this is essentially equivalent to as.matrix(object).
signature(from = "spam", to = "list") this is essentially equivalent to triplet(object).
signature(from = "spam", to = "vector") this is essentially equivalent to object@entries (structurebased=TRUE) or c(object).
signature(from = "spam", to = "logical") the entries are forced to logicals (nonzeros only in case of structurebased=TRUE).
signature(from = "spam", to = "integer") the entries are forced to integers (nonzeros only in case of structurebased=TRUE).

Examples

ifelse( diag.spam(2) %*% c(0,1), TRUE, FALSE)

Coercion

Description

Coercion of spam matrices to proper vector objects

Usage

## S4 method for signature 'spam'
as.vector(x, mode = "any")

Arguments

- x: spam object.
- mode: character string naming an atomic mode or "any"/"list"/"expression".

Details

This coercion allows smooth transitions between different matrix formats, see example below. The Cholesky factors are first transformed to a spam object.
Value

If `structurebased=TRUE`, the vector `x@entries`. Conversely, if `structurebased=FALSE`, the result is identical to one with `as.vector(as.matrix(x))`.

Author(s)

Reinhard Furrer

See Also

`spam.options`

Examples

```r
x <- diag(2)
ifelse(x, x, 1-x)
ifelse(x, as.vector(x), 1-as.vector(x))

x <- diag.spam(2)
options(spam.structurebased=FALSE)
ifelse(x, as.vector(x), 1-as.vector(x))
options(spam.structurebased=TRUE)
ifelse(x, as.vector(x), 1-as.vector(x))
```

complexity  

*Complexity for Sparse Matrices*

Description

A few results of computational complexities for selected sparse algorithms in `spam`.

Details

A Cholesky factorization of an n-matrix requires $n^3/3$ flops. In case of banded matrices (bandwidth $p$, $p \ll n$) a factorization requires about $2np^{3/2}$ flops. Forward- and backsolves for banded matrices require essentially $2np$ flops.

George and Liu (1981) proves that any reordering would require at least $O(n^{3/2})$ flops for the factorization and produce at least $O(n \log(n))$ fill-ins for square lattices with a local neighborhood. They also show that algorithms based on nested dissection are optimal in the order of magnitude sense.

More to follow.

References

See Also

det, solve, forwardsolve, backsolve and ordering.

---

**constructors**  
**Slot modification**

**Description**

Modify slots of spam objects

**Usage**

```r
rowpointers(x) <- value
colindices(x) <- value
entries(x) <- value
```

**Arguments**

- `x`  
  a spam matrix

- `value`  
  vector of appropriate length.

**Details**

Various tests are performed. Thus much slower than direct assignment.  
Slot dimension should be changed through `pad` or `dim`

**Value**

Modified spam object.

**Author(s)**

Reinhard Furrer

**Examples**

```r
x <- diag.spam(2)
rowpointers(x) <- c(1,1,3)

# The last line is equivalent to
x@rowpointers <- as.integer(c(1,1,3))
```
covmat

Covariance functions

Description

Evaluate a covariance function.

Usage

covmat(h, theta, ..., type="sph")

cov.exp(h, theta, ..., eps=getOption("spam.eps"))
cov.sph(h, theta, ..., eps=getOption("spam.eps"))
cov.nug(h, theta, ..., eps=getOption("spam.eps"))
cov.wu1(h, theta, ..., eps=getOption("spam.eps"))
cov.wu2(h, theta, ..., eps=getOption("spam.eps"))
cov.wu3(h, theta, ..., eps=getOption("spam.eps"))
cov.wend1(h, theta, ..., eps=getOption("spam.eps"))
cov.wend2(h, theta, ..., eps=getOption("spam.eps"))
cov.mat(h, theta, ..., eps=getOption("spam.eps"))

Arguments

h object containing the lags.
theta parameter of the covariance function, see ‘Details’.
type covariance function specification.
... arguments passed from other methods.
eps tolerance level.

Details

covmat is a wrapper that calls the other functions according to the argument type. The nomenclature is similar to `premat`.
The parametrization is (range, partial- sill, [smoothness = 1], [nugget = 0]), where only the range needs to be specified. In case of negative parameter values, a warning is issued and the absolute value is retained. Although more cryptic, having all arguments as a single vector simplifies optimization with `optim`.
Currently, the functions distinguish between a sparse `spam` object `h` and any other numeric type. In the future, this might change and appropriate methods will be implemented.

Value

Covariance function evaluated on `h`. 
crossprod

Author(s)
Reinhard Furrer

References
Any classical book about geostatistics.

See Also
precmat.

Examples

```r
locs <- cbind(runif(10),runif(10))
h <- nearest.dist(locs, delta=.3)
Sigma <- cov.sph(h, c(.3, 1, .1))

# Not run:
h <- seq(0, to=1, length.out=100)
plot(h, cov.exp(h, c(1/3,1)), type='l', ylim=c(0,1))
type <- c("sph","wendland1","wendland2","wu1","wu2","wu3")
for (i in 1:6)
  lines(h, covmat(h, 1, type=type[i]), col=i+1)
legend('topright',legend=type, col=2:7, lty=1)
```

## End(Not run)

### crossprod

**Spam Matrix Crossproduct**

**Description**
Given matrices \( x \) and \( y \) as arguments, return a matrix cross-product. This is formally equivalent to (but usually slightly faster than) the call \( t(x) \times y \) (crossprod.spam) or \( x \times t(y) \) (tcrossprod.spam).

**Usage**

```r
crossprod.spam(x, y = NULL)
tcrossprod.spam(x, y = NULL)
```

**Arguments**

\( x, y \) matrices: \( y = \text{NULL} \) is taken to be the same matrix as \( x \). Vectors are promoted to single-column or single-row matrices, depending on the context.
Value

A double matrix

Note

When \( x \) or \( y \) are not matrices, they are treated as column or row matrices.

Author(s)

Reinhard Furrer

Examples

\[
\text{crossprod.spam(diag.spam(2),1:2)}
\]

---

**det**

*Calculate the determinant of a positive definite Sparse Matrix*

Description

**det** and **determinant** calculate the determinant of a positive definite sparse matrix. **determinant** returns separately the modulus of the determinant, optionally on the logarithm scale, and the sign of the determinant.

Usage

\[
\text{det}(x, \ldots) \\
\text{determinant}(x, \text{logarithm} = \text{TRUE}, \ldots)
\]

Arguments

- **x**: sparse matrix of class \texttt{spam} or a Cholesky factor of class \texttt{spam.chol.NgPeyton}.
- **logarithm**: logical; if \text{TRUE} (default) return the logarithm of the modulus of the determinant.
- **...**: Optional arguments. Examples include method argument and additional parameters used by the method.

Details

If the matrix is not positive definite, the function issues a warning and returns \texttt{NA}.

The determinant is based on the product of the diagonal entries of a Cholesky factor, i.e. internally, a Cholesky decomposition is performed. By default, the \texttt{NgPeyton} algorithm with minimal degree ordering us used. To change the methods or supply additional parameters to the Cholesky factorization function, see the help for \texttt{chol}.

The determinant of a Cholesky factor is also defined.
Value

For `det`, the determinant of `x`. For `determinant`, a list with components

- `modulus`: a numeric value. The modulus (absolute value) of the determinant if `logarithm` is `FALSE`; otherwise the logarithm of the modulus.
- `sign`: integer; either +1 or -1 according to whether the determinant is positive or negative.

See Also

- `chol.spam`

Examples

```r
x <- spam(c(4,3,0,3,5,1,0,1,4),3)
det(x)
determinant(x)
det(chol(x))
```

---

**diag**  
**Sparse Matrix diagonals**

Description

Extract or replace the diagonal of a matrix, or construct a diagonal matrix.

Usage

```r
## diag(x)
## diag(x=1, nrow, ncol, names = TRUE)
diag(x) <- value

diag.spam(x=1, nrow, ncol)
spam_diag(x=1, nrow, ncol)
diag.spam(x) <- value
```
Arguments

- **x**: a spam matrix, a vector or a scalar.
- **nrow**, **ncol**: Optional dimensions for the result.
- **value**: either a single value or a vector of length equal to that of the current diagonal.

Details

Using `diag(x)` can have unexpected effects if `x` is a vector that could be of length one. Use `diag(x, nrow = length(x))` for consistent behaviour.

Value

If `x` is a spam matrix then `diag(x)` returns the diagonal of `x`.

The assignment form sets the diagonal of the sparse matrix `x` to the given value(s).

diag.spam works as `diag` for spam matrices: If `x` is a vector (or 1D array) of length two or more, then `diag.spam(x)` returns a diagonal matrix whose diagonal is `x`. `spam_diag` is an alias for `diag.spam` and in the spirit of the result of `diag` is a spam object.

If `x` is a vector of length one then `diag.spam(x)` returns an identity matrix of order the nearest integer to `x`. The dimension of the returned matrix can be specified by `nrow` and `ncol` (the default is square).

The assignment form sets the diagonal of the matrix `x` to the given value(s).

- `upper.tri`, `lower.tri`.

Examples

```r
diag.spam(2, 4)        # 2x4
smat <- diag.spam(1:5)
diag(smat)
diag(smat) <- 5:1

# The last line is equivalent to
diag.spam(smat) <- 5:1

# Note that diag.spam(1:5) <- 5:1 not work of course.
```
**diff**

**Lagged Differences**

**Description**

Returns suitably lagged and iterated differences.

**Usage**

```r
# diff.spam(x, lag = 1, differences = 1, ...)
## S4 method for signature 'spam'
diff(x, lag = 1, differences = 1, ...)
```

**Arguments**

- `x`: a spam matrix containing the values to be differenced.
- `lag`: an integer indicating which lag to use.
- `differences`: an integer indicating the order of the difference.
- `...`: further arguments to be passed to or from methods.

**Value**

A spam matrix with elements similar to `as.spam(diff(as.matrix(x), ...))`.

**Author(s)**

Reinhard Furrer

**See Also**

diff in base, precmat.

**Examples**

```r
# incidence matrix for a RW(3) model
d <- diff.spam(diag.spam(10), lag=1, differences=3)
t(D)
```
Description

Retrieve or set the dimension of an spam object.

Usage

```r
# dim(x)
# dim(x) <- value
```

Arguments

- `x` a spam matrix
- `value` A numeric two-vector, which is coerced to integer (by truncation).

Details

In older version of spam, the behavior of the replacement method was different and is now implemented in `pad.spam`.

Value

`dim` retrieves the dimension slot of the object. It is a vector of mode `integer`. The replacement method changes the dimension of the object by rearranging.

Author(s)

Reinhard Furrer

See Also

- `pad.spam`

Examples

```r
x <- diag(4)
dim(x) <- c(2,8)
x

s <- diag.spam(4)
dim(s) <- c(2,8)  # result is different than x
s <- diag.spam(4)
pad(s) <- c(7,3)  # any positive value can be used
```
Display the Nonzero Entries

**Description**

The function represents the nonzero entries in a simple bicolor plot.

**Usage**

```r
display(x, ...)
```

**Arguments**

- `x` matrix of class `spam` or `spam.chol.NgPeyton`
- `...` any other arguments passed to `image.default` or `plot`.

**Details**

`spam.getOption("imagesize")` determines if the sparse matrix is coerced into a matrix and the plotted with `image.default` or if the matrix is simply represented as a scatterplot with `pch="."`. The points are scaled according to `cex*spam.getOption("cex")/(nrow + ncol)`. For some devices or for non-square matrices, `cex` needs probably some adjustment.

`image`, `spam.options`

**Examples**

```r
set.seed(13)

nz <- 8
ln <- nz
smat <- spam(0, ln, ln)
smat[cbind(sample(ln, nz), sample(ln, nz))] <- 1:nz

par(mfcol=c(1,2), pty='s')
options(spam.imagesize = 1000)
display(smat)
options(spam.imagesize = 10)
display(smat)

# very large but very sparse matrix
nz <- 128
```
ln <- nz^2
smat <- spam(0, ln, ln)
smat[cbind(sample(ln, nz), sample(ln, nz))] <- 1:nz

par(mfcol=c(1, 1), pty='s')
display(smat, cex = 100)

eigen

Eigenvalues for Sparse Matrices

Description

Functions to calculate eigenvalues and eigenvectors of sparse matrices. It uses the value of spam.options("inefficiencywarning") to dispatch between base::eigen() or the Implicitly Restarted Arnoldi Process, using 'ARPACK'.
eigen.spam is a wrapper function of eigen_approx and transforms its output to base::eigen like.

Usage

eigen.spam(x, nev = 10, symmetric, only.values = FALSE, control = list())
eigen_approx(x, nev, ncv, nitr, mode, only.values = FALSE, verbose = FALSE, f_routine)

Arguments

x a matrix of class spam whose nev eigenvalues and eigenvectors are to be computed.
nev number of eigenvalues to calculate.
symmetric if TRUE, the matrix is assumed to be symmetric.
only.values if TRUE, only nev eigenvalues are computed and returned, otherwise nev eigenvalues and eigenvectors are returned.
control additional options, see ‘Details’.
ncv see ‘Details’, use the control option for eigen.spam.
nitr see ‘Details’, use the control option for eigen.spam.
mode see ‘Details’, use the control option for eigen.spam.
verbose see ‘Details’, use the control option for eigen.spam.
f_routine only for eigen_approx, to call the Fortran routine for symmetric matrices set this option to "ds_eigen_f" and for non symmetric to "dn_eigen_f".
Details

mode = "LM": there are different modes available for this function, each mode returns a different range of eigenvalues. Also the available modes are dependent, whether the input matrix is symmetric or not:

"LM": Eigenvalues with largest magnitude (sym, non sym), that is, largest eigenvalues in the Euclidean norm of complex numbers.
"SM": Eigenvalues with smallest magnitude (sym, non sym), that is, smallest eigenvalues in the Euclidean norm of complex numbers.
"LR": Eigenvalues with largest real part (non sym).
"SR": Eigenvalues with smallest real part (non sym).
"LI": Eigenvalues with largest imaginary part (non sym).
"SI": Eigenvalues with smallest imaginary part (non sym).
"LA": Eigenvalues with largest algebraic value (sym), that is, largest eigenvalues inclusive of any negative sign.
"SA": Eigenvalues with smallest algebraic value (sym), that is, smallest eigenvalues inclusive of any negative sign.

ncv: the largest number of basis vectors that will be used in the Implicitly Restarted Arnoldi Process. Work per major iteration is proportional to \( x@dimension[1] \times ncv \times ncv \). The default is set if symmetric to \( \min(x@dimension[1] + 1, \max(2 \times nev + 1, 200)) \) or else to \( \min(x@dimension[1] - 1, \max(2 \times nev + 1, 100)) \). Note, this value should not be chosen arbitrary large, but slightly larger than nev. Otherwise it could lead to memory allocation problems.

nitr: the maximum number of iterations. The default is set to \( ncv + 1000 \)

spamflag = FALSE: if TRUE, the Implicitly Restarted Arnoldi Process is used, independent of the dimension of the respective matrix.

verbose = FALSE: print additional information.

cmplxeps: threshold to determine whether a double value is zero, while transforming the ARPACK output to R class complex. The default is set to \$.Machine$double.eps.\n
Value

A vector of the length corresponding to the dimension of the input matrix. Containing the required nev eigenvalues. If requested also the corresponding eigenvectors. In the non symmetric case, the eigenvalues are returned in a matrix with a column containing the real parts and a column containing the imaginary parts of the eigenvalues. The eigenvectors are then returned in two matrices.

Note

For non symmetric matrices it can not be guaranteed, that the Fortran code is stable. The user is advised to choose the control options carefully, see ‘Details’ for more information.

Examples

```r
gmrf <- precmat.GMRFreglat(50, 50, c(.4,.3,.2,.1),'m2p4')
eigen.spam(gmrf, nev = 50, control = list(mode = "LM"))
```

Description

These functions are simple wrappers to nearest.dist to be used in fields.

Usage

```r
spam_rdist( x1, x2, delta = 1)
spam_rdist.earth( x1, x2, delta = 1, miles=TRUE, R=NULL)
```

Arguments

- `x1`: Matrix of first set of locations where each row gives the coordinates of a particular point.
- `x2`: Matrix of second set of locations where each row gives the coordinates of a particular point.
- `delta`: only distances smaller than delta are recorded, see Details.
- `miles`: For great circle distance: If true distances are in statute miles if false distances in kilometers.
- `R`: Radius to use for sphere to find spherical distances. If NULL the radius is either in miles or kilometers depending on the values of the miles argument. If R=1 then distances are of course in radians.

Details

These functions are wrappers to rdist and rdist.earth in fields. They are used to simplify the use of sparse matrices in functions like mKrige.

For great circle distance, the matrices x1 and x2 contain the degrees longitudes in the first and the degrees latitudes in the second column. delta is in degrees. Hence to restrict to distances smaller than delta.km, one has to specify delta=delta.km*360/(6378.388*2*pi).
A spam object containing the distances spanned between zero and delta. The sparse matrix may contain many zeros (e.g., collocated data). However, to calculate covariances, these zeros are essential.

**Author(s)**

Reinhard Furrer

*nearest.dist*

**Examples**

```r
## Not run:
require(fields)
look <- mKrig(x,Y, Covariance="Wendland", dimension=2, k=1,
cov.args=list(Distance='spam_rdist'))

## End(Not run)
```

---

**Description**

Transform between the spam sparse format to the matrix.csr format of SparseM and dgRMatrix format of Matrix

**Usage**

- `as.spam.matrix.csr(x)`
- `as.dgRMatrix.spam(x)`
- `as.dgCMatrix.spam(x)`
- `as.spam.dgRMatrix(x)`
- `as.spam.dgCMatrix(x)`

**Arguments**

- `x` sparse matrix of class spam, matrix.csr, dgRMatrix or dgCMatrix.
Details

We do not provide any S4 methods and because of the existing mechanism a standard S3 does not work.

The functions are based on `require`.

Notice that `as.matrix.csr.spam` should read as `as."matrix.csr".spam`.

Value

According to the call, a sparse matrix of class `spam`, `matrix.csr`, `dgRMatrix` or `dgCMatrix`.

Author(s)

Reinhard Furrer

See Also

`triplet.Matrix` or `matrix.csr`

Examples

```r
## Not run:
S <- diag.spam(4)
R <- as.dgRMatrix.spam( S)
C <- as.dgCMatrix.spam( S)
as.spam.dgCMatrix(C)
slotNames(U)
slotNames(R)
# For column oriented sparse formats a transpose does not the job,
# as the slot names change.

# as.spam(R) does not work.

## End(Not run)

## Not run:
# for transformations between SparseM and spam:
as.matrix.csr.spam <- function(x,...) {
  newx <- new("matrix.csr")
  slot(newx,"ra",check=FALSE) <- x@entries
  slot(newx,"ja",check=FALSE) <- x@colindices
  slot(newx,"ia",check=FALSE) <- x@rowpointers
  slot(newx,"dimension",check=FALSE) <- x@dimension
  return(newx)
}
U <- as.matrix.csr.spam( S)

## End(Not run)
```
germany.data

## Not run:
# a dataset contained in Matrix
data(KNex)
as.spam.dgCMatrix(KNex$mm)

## End(Not run)

---

**germany.data**

*Meta-data about administrative districts of Germany*

### Description

Data for the display of data over the administrative districts of Germany

### Format

`germany.info` is a list with elements

- `n` 544 (number of districts around 1990).
- `xrep, yrep` representative coordinates of the districts (vectors of length 544)
- `xlim, ylim` 2-vectors defining the limits of the districts.
- `polyid` linking the polygons to the districts (599 vector).
- `id` linking the districts to Community Identification Number.

`germany.poly` defines the polygons. It is a 17965 by two matrix, each polygon separated by a row of NAs, each district by two rows.

`germany` defines the polygons in form of a list (backwards compatibility).

### Details

The representative coordinates are calculated based on the mean value of the polygon coordinates. This creates sometimes strange values, e.g., district Leer.

### Author(s)

Reinhard Furrer

### References

The meta-data has been constructed based on (essentially) files from the package **INLA**, see `demo(Bym)`.

See also [http://de.wikipedia.org/wiki/Amtlicher_Gemeindeschl%C3%BCssel](http://de.wikipedia.org/wiki/Amtlicher_Gemeindeschl%C3%BCssel) and [http://de.wikipedia.org/wiki/Liste_der_Landkreise_in_Deutschland](http://de.wikipedia.org/wiki/Liste_der_Landkreise_in_Deutschland)

germany.plot Oral.

Examples

# Plot the Bundeslaender:
germany.plot(germany.info$id%/%1000, col=rep(2:8,3), legend=FALSE)

description

Displaying data over the administrative districts of Germany

Usage

germany.plot(vect, col=NULL, zlim=range(vect), legend=TRUE,
main=NULL, cex.axis=1, cex.main=1.5, add=FALSE, ... )

Arguments

vect vector of length 544

col color scheme to be used. By default uses colorRampPalette(brewer.pal(9,"Blues"))(100).

zlim the minimum and maximum values for which colors should be plotted, default-
ing to the range of data.

legend Should the legend be added, see ‘Details’.

main an overall title for the plot.

cex.axis label size of legend.

cex.main label size of overall plot title.

add logical, if true adds to current plot.

... additional arguments passed to polygon.

Details

The legend is only added, provided (a) function image.plot is available.

The perfect position of the legend is an art per se and depends on various par parameters. One possibi-

lity for finer control is to not plot it and to manually call the function image.plot of fields.

# Plot the Bundeslaender:
georgia.plot(germany.info$id%/%1000,col=rep(2:8,3), legend=FALSE)

grid_trace2

Two trace plots and a scatter plot.

Description

For two (MCMC) chains of the same length trace plots and a scatter plot are drawn.

Usage

grid_trace2(chain1, chain2 = NULL,
xlim = NULL, ylim1 = NULL, ylim2=NULL,
chain1_lab = "", chain2_lab = "", main = "",
chain1_yaxis_at = NULL, chain2_yaxis_at = NULL,
log = FALSE,
cex_points = unit(0.2, "mm"),
cex_main = unit(1.2, "mm"),
lwd_lines = unit(0.1, "mm"),
lwd_frame = unit(0.8, "mm"),
draw = TRUE)

Arguments

chain1 Numeric vector or a matrix with two columns.
chain2 Numeric vector of same length as chain1. (Only used if chain1 is specified as vector).
xlim x axis limits of both chains (numeric vector of length 2).
ylim1 y axis limits of chain 1 (numeric vector of length 2).
ylim2 y axis limits of chain 2 (numeric vector of length 2).
chain1_lab Label of chain 1 (character of length 1).
chain2_lab  Label of chain 2 (character of length 1).
main       Title (character of length 1).
chain1_yaxis_at  Points at which tick-marks are drawn for chain 1.
chain2_yaxis_at  Points at which tick-marks are drawn for chain 2.
log         Logical, should the date be log transformed?
cex_points  Size of points in scatter plot.
cex_main    Size of the title font.
lwd_lines   Line width of trace plots.
lwd_frame   Line width of frames.
draw        Logical, should the returned grob object be drawn?

Details

The figure is optimized for a plot of the format x11(width = 10, height = 3).

Value

A grob object.

Author(s)

Florian Gerber <florian.gerber@math.uzh.ch>

See Also

grid_zoom

Examples

grid_trace2(runif(500), runif(500),
            chain1_yaxis_at = seq(.2, 1, by = .2),
            chain1_lab = "chain1", chain2_lab = "chain2",
            main = "Uniform",
            lwd_lines = unit(.5, "mm"))
This function takes a grob object (e.g. created with package grid) and adds a zoom window.

Usage

```r
grid_zoom(inputGrob = pointsGrob(runif(200), runif(200)),
           inputViewport = viewport(name='main'),
           x = 'topleft', y, just,
           ratio = c(.3,.4), zoom_xlim, zoom ylim,
           rect = TRUE, rect_lwd = 1, rect_fill = 'gray92',
           draw = TRUE, zoom_fill = 'white',
           zoom_frame_gp = gpar(lwd = 1),
           zoom gp = NULL, zoom_xaxis = xaxisGrob(main = FALSE),
           zoom_yaxis = NULL)
```

Arguments

- **inputGrob**: A grob object, e.g created with package grid.
- **inputViewport**: Viewport related to inputGrob.
- **x**: Specifies the x coordinate of the zoom window. Alternatively it can be set to 'topleft', 'topright', 'bottomleft' or 'bottomright'
- **y**: Specifies the y coordinate of the zoom window.
- **just**: Specifies the justification of the zoom window.
- **ratio**: Specifies size of the zoom window relative to the main window.
- **zoom_xlim**: Specifies xlim value of the zoom window.
- **zoom ylim**: Specifies ylim value of the zoom window.
- **rect**: Logical, if TRUE a rectangle of the zoom region is draw in the main window.
- **rect_lwd**: lwd of the rectangle.
- **rect_fill**: fill of the rectangle.
- **draw**: logical, if TRUE the returned grob object is also drawn.
- **zoom_fill**: fill color of the zoom window.
- **zoom_frame_gp**: gpar() of the frame of the zoom window.
- **zoom gp**: gpar() of the inputGrob in the zoom viewport.
- **zoom_xaxis**: xaxisGrob() to draw for the zoom window.
- **zoom_yaxis**: yaxisGrob() to draw for the zoom window.
Details

A zoom plot does only make sense if all objects of the inputGrob are specified in native units. Additional caution must be required for certain grobs: e.g. a zoom of a circleGrob() is problematic if the x and y axis are stretched by a different amount.

Value

A grob object.

Author(s)

Florian Gerber <florian.gerber@math.uzh.ch>

See Also

grid_trace2

Examples

```r
## -- Example 1 --
set.seed(133)
grid_zoom(inputGrob = pointsGrob(runif(200), runif(200)),
  inputViewport = viewport(name = 'main'),
  zoom_xlim = c(.2, .3), zoom ylim = c(.2, .3))

## -- Example 2 --
## initial plot
grid.newpage()
vp <- viewport(width=.8, height=.8, clip='on')
gt <- gTree(children=gList(polylineGrob(x=c(0:4)/10, rep(.5, 5), 10:6)/10, rep(.5, 5)),
  y=c(rep(.5, 5), 10:6/10, rep(.5, 5), 0:4/10),
  id=rep(1:5, 4), default.units='native',
  gp=gpar(col=1:5, lwd=3)),
  pointsGrob(runif(1000), runif(1000),pch='.', gp=gpar(cex=3)),
  rectGrob(gp=gpar(lwd=3)))
pushViewport(vp)
grid.draw(gt)

## plot with zoom window
grid.newpage()
grid_zoom(inputGrob = gt,
  inputViewport = vp,
  x='topright', zoom_xlim=c(.6,.73), zoom_ylim=c(.3,.43),ratio=.4,
  zoom_xaxis = NULL, zoom_gp = gpar(cex=3))
```
**head**  
*Return the First or Last Part of an Object*

**Description**

Returns the upper left or lower right part of a spam object.

**Usage**

```r
## S4 method for signature 'spam'
head(x, n = 6L, m = n, ...)
## S4 method for signature 'spam'
tail(x, n = 6L, m = n, addrownums = TRUE, ...)
```

**Arguments**

- `x`: a spam object
- `n`: a single integer. If positive, size for the resulting object: number of elements for a vector (including lists), rows for a matrix or data frame or lines for a function. If negative, all but the `n` last/first number of elements of `x`.
- `m`: similar to `n` but for the number of columns.
- `addrownums`: create row and column names from the selected elements.
- `...`: arguments to be passed to or from other methods.

**Details**

For matrices, 2-dim tables and data frames, `head()` (`tail()`) returns the first (last) `n` rows and `m` columns when `n > 0` or all but the last (first) `n` rows when `n < 0` (with similar behavior for `m`).

`tail()` will add row and column names of the form "[n,]" and "[,n]" to the result, so that it looks similar to the last lines and columns of `x` when printed. Setting `addrownums = FALSE` suppresses this behaviour.

A method for `spam.chol.NgPeyton` objects is exported as well.

**Value**

An regular matrix.

**Author(s)**

Reinhard Furrer

**Examples**

```r
head( precmat.RW2( 10))
tail( precmat.season(n=10, season=3), n=4, m=10)
```
**image**

*Display a spam Object as Color Image*

**Description**

The function creates a grid of colored rectangles with colors corresponding to the values in z.

**Usage**

```r
## S4 method for signature 'spam'
image(x, cex = NULL, ...)
```

**Arguments**

- `x` matrix of class spam orspam.chol.Ng Peyton.
- `cex` for very large matrices, the dot size may need to be scaled.
- `...` any other arguments passed to image.default and plot.

**Details**

getOption("spam.imagesize") determines if the sparse matrix is coerced into a matrix and the plotted similarly to image.default or if the matrix is simply represented as a scatterplot with pch=".". The points are scaled according to cex*getOption("spam.cex")/(nrow+ncol). For some devices or for non-square matrices, cex needs probably some adjustment.

The a zero matrix in spam format has as (1,1) entry the value zero and only missing entries are interpreted as NA in the scatter plot.

**Author(s)**

Reinhard Furrer

**See Also**

display and spam.options.

The code is based on image of graphics.

**Examples**

```r
set.seed(13)
nz <- 8
ln <- nz
smat <- spam(0, ln, ln)
smat[ cbind(sample(ln,nz), sample(ln,nz))] <- 1:nz

par(mfcol=c(1,2),pty='s')
options(spam.imagesize=10000)
image(smat) # better: col=tim.colors(nz)
options(spam.imagesize=10)
```
```r
image(smat) # better: col=tim.colors(nz))

nz <- 128
ln <- nz*2
smat <- spam(0,ln,ln)
smat[cbind(sample(ln,nz), sample(ln,nz))] <- 1:nz

par(mfcol=c(1,1), pty='s')
image(smat,cex=100) # better:, col=tim.colors(nz))
```

---

**import**  **Read External Matrix Formats**

**Description**

Read matrices stored in the Harwell-Boeing or MatrixMarket formats.

**Usage**

```r
read.HB(file)
read.MM(file)
```

**Arguments**

- `file` the name of the file to read, as a character scalar. Alternatively, `read.HB` and `read.MM` accept connection objects.

**Details**

The names of files storing matrices in the Harwell-Boeing format usually end in ".rua" or ".rsa". Those storing matrices in the MatrixMarket format usually end in ".mtx".

Currently, only real assembled Harwell-Boeing can be read with `read.HB`. Reading MatrixMarket formats is more flexible. However, as entries of `spam` matrices are of mode double, integers matrices are coerced to doubles, patterns lead to matrices containing ones and complex are coerced to the real part thereof. In these aforementioned cases, a warning is issued.

MatrixMarket also defines an array format, in which case a (possibly) dense `spam` object is return (retaining only elements which are larger than options('spam.eps')). A warning is issued.

**Value**

A sparse matrix of class `spam`.

**Note**

The functions are based on `readHB` and `readMM` from the library `Matrix` to build the connection and read the raw data. At present, `read.MM` is more flexible than `readMM`. 
isSymmetric

Test if a spam matrix is Symmetric

Description

Efficient function to test if 'object' is symmetric or not.

Usage

# isSymmetric.spam(object, ...)  
## S3 method for class 'spam'  
isSymmetric(object, tol = 100 * .Machine$double.eps, ...)

Arguments

object a spam matrix.

tol numeric scalar >= 0. Smaller differences are not considered, see all.equal.spam.

... further arguments passed to all.equal.spam.
Details

symmetry is assessed by comparing the sparsity structure of object and t(object) via the function all.equal.spam. If a difference is detected, the matrix is cleaned with cleanup and compared again.

Value

logical indicating if object is symmetric or not.

Author(s)

Reinhard Furrer

See Also

all.equal.spam, cleanup.

Examples

obj <- diag.spam(2)
isSymmetric(obj)

obj[1,2] <- .Machine$double.eps
isSymmetric(obj)
all.equal(obj, t(obj))
Details

The sparsity structure is determined by the ordinary `%*%`. Hence, the result of `kronecker(X, Y, FUN = "+")` is different depending on the input.

Value

An array `A` with dimensions `dim(X) * dim(Y)`.

Author(s)

Reinhard Furrer

Examples

```r
# Starting with non-spam objects, we get a spam matrix
kronecker.spam(diag(2), array(1:4, c(2, 2)))

kronecker(diag.spam(2), array(1:4, c(2, 2)))

# Notice the preservation of sparsity structure:
kronecker(diag.spam(2), array(1:4, c(2, 2)), FUN="+")
```

Description

The R package `spam` can handle sparse matrices with up to $2^{31}-1$ non-zero elements. For matrices with more non-zero elements it is necessary to load the `spam64` package in addition.

Details

With the help of the R package `dotCall64` spam interfaces either the compiled code with 32-bit integers provided in `spam` or the compiled code with 64-bit integers provided in `spam64`.

Author(s)

Reinhard Furrer, Florian Gerber, Kaspar Moesinger, Daniel Gerber

References

lower.tri

Description

Returns the lower or upper triangular structure or entries of a sparse matrix.

Usage

lower.tri(x, diag = FALSE)
upper.tri(x, diag = FALSE)

Arguments

x a sparse matrix of class spam
diag logical. Should the diagonal be included?

Details

Often not only the structure of the matrix is required but the entries as well. For compatibility, the default is only a structure consisting of ones (representing TRUEs). Setting the flag getOption("spam.trvalues") to TRUE, the function returns the actual values.

See Also

spam.options and diag
Examples

```r
smat <- spam(c(1,2,0,3,0,0,0,4,5),3)
upper.tri(smat)
upper.tri(smat, diag=TRUE)

options(spam.trivalent=true)
upper.tri(smat)
```

Description

Creates precision matrices for gridded GMRF.

Usage

```r
precmat.GMRFreglat(n,m, par, model = "m1p1", eps = getOption("spam.epochs"))
```

Arguments

- `n`: first dimension of the grid.
- `m`: second dimension of the grid.
- `par`: parameters used to construct the matrix.
- `model`: see details and examples.
- `eps`: A tolerance parameter: elements of `x` such that `abs(x) <= eps` set to zero. Defaults to `eps = getOption("spam.epochs")`

Details

The function should be illustrative on how to create precision matrices for gridded GMRF. Hence, no testing (positive definiteness is done). The model specification "m" determines the complexity and "p" the number of parameters. Please see the examples on the meaning of the different models.

Value

A spam matrix of dimension `prod(dims)xprod(dims)`.

Author(s)

Reinhard Furrer

`precmat`, `toeplitz.spam`, `kronecker.spam`
Examples

as.matrix(precmat.GMRFreglat(4, 3, c(.4), 'm1p1'))
as.matrix(precmat.GMRFreglat(4, 3, c(.4,.3), 'm1p2'))
as.matrix(precmat.GMRFreglat(4, 3, c(.4,.3,.2), 'm2p3'))
as.matrix(precmat.GMRFreglat(4, 3, c(.4,.3,.2,.1), 'm2p4'))

# up to the diagonal, the following are equivalent:
cleanup( precmat.IGMRFreglat(3,4) -
          precmat.GMRFreglat(3,4,1, 'm1p1'))

---

map.landkreis  Administrative districts of Germany

Description

Displaying data over the administrative districts of Germany

Usage

map.landkreis(data, col=NA, zlim=range(data), add=FALSE,
               legendpos=c(0.88,0.9,0.05,0.4))

Arguments

data  vector of length 544
col   color scheme to be used. By default uses tim.colors if available or a generic
      gray scale.
zlim  the minimum and maximum values for which colors should be plotted, defaulting
      to the range of data.
add   logical, if true adds to current plot.
legendpos  if package fields is loaded, puts a legend at that position.

Details

The function germany.plot super-seeds map.landkreis (it is several factors faster).

The perfect position of the legend is an art per se and depends on various par parameters. See also
the source code of the function image.plot of fields.

Author(s)

Reinhard Furrer

References

The code of map.landkreis is very similar to germany.map from the package INLA.
### Math

#### Mathematical functions

**Description**

Applies the Math group functions to spam objects

**Usage**

```r
# ceiling(x)
# floor(x)
# exp(x, base = exp(1))
# log(x, base = exp(1))
# sqrt(x)

# abs(x)
# cumprod(x)
# cumsum(x)

# cos(x)
# sin(x)
# tan(x)

# acosh(x)
```

**Arguments**

- `x` spam object.
- `base` positive number. The base with respect to which logarithms are computed. Defaults to `e=exp(1)`.
Details

It is important to note that the zero entries do not enter the evaluation when `structurebased=FALSE`. The operations are performed on the stored non-zero elements. This may lead to differences if compared with the same operation on a full matrix.

Value

If the option `spam.structurebased=TRUE`, all functions operate on the vector `x@entries` and return the result thereof. Conversely, if `structurebased=FALSE`, the result is identical to one with `as.matrix(x)` input and an as.spam purger.

cos(smat)

options(spam.structurebased=FALSE)
cos(smat)

sqrt(smat)

Math2

Rounding of Numbers

Description

Applies the Math2 group functions to 'spam' objects

Usage

```r
## S4 method for signature 'spam'
round(x, digits = 0)
## S4 method for signature 'spam'
signif(x, digits = 6)
```
Arguments

x spam object.
digits integer indicating the precision to be used.

Value

All functions operate on the vector x@entries and return the result thereof.

Description

Maximum likelihood estimates of a simple spatial model

Usage

neg2loglikelihood.spam(y, X, distmat, Covariance,
beta, theta, Rstruct = NULL, ...)

neg2loglikelihood(y, X, distmat, Covariance,
beta, theta, ...)

mle.spam(y, X, distmat, Covariance,
beta0, theta0,
theta.lower, theta.upper, optim.control=NULL,
Rstruct = NULL, hessian = FALSE,...)

mle(y, X, distmat, Covariance,
beta0, theta0,
theta.lower, theta.upper, optim.control=NULL,
hessian = FALSE, ...)

mle

Maximum likelihood estimates
mle

mle.nmean.spam(y, distmat, Covariance,
theta0,
thalower, thetaupper, optim.control=NULL,
Rstruct = NULL, hessian = FALSE, ...)

mle.nmean(y, distmat, Covariance,
theta0,
thalower, thetaupper, optim.control=NULL,
hessian = FALSE, ...)

Arguments

y            data vector of length n.
X            the design matrix of dimension n x p.
distmat      a distance matrix. Usually the result of a call to nearest.dist.
Covariance   function defining the covariance. See example.
beta         parameters of the trend (fixed effects).
theta         parameters of the covariance structure.
Rstruct       the Cholesky structure of the covariance matrix.
beta0,theta0  initial values.
thalower,thetoupper
lower and upper bounds of the parameter theta.
optim.control arguments passed to optim.
hessian       Logical. Should a numerically differentiated Hessian matrix be returned?
...           additional arguments passed to chol.

Details

We provide functions to calculate the negative-2-log-likelihood and maximum likelihood estimates
for the model

y ~ N_n( X beta, Sigma(h;theta) )

in the case of a sparse or ordinary covariance matrices.

In the case of the |ai| spam versions, the covariance function has to return a spam object. In the other
case, the methods are correctly overloaded and work either way, slightly slower than the |ai| spam
counterparts though.

When working on the sphere, the distance matrix has to be transformed by

h -> R / 2 sin(h/2)

where R is the radius of the sphere.

The covariance function requires that the first argument is the distance matrix and the second the
parameters. One can image cases in which the covariance function does not take the entire distance
matrix but only some partial information thereof. (An example is the use of a kronecker type
covariance structure.) In case of a sparse covariance construction where the argument Rstruct is
not given, the first parameter element needs to be the range parameter. (This results from the fact, that a sparse structure is constructed that is independent of the parameter values to exploit the fast Choleski decomposition.)

In the zero-mean case, the neg2loglikelihood is calculated by setting the parameters X or beta to zero.

**Value**

The negative-2-loglikelihood or the output from the function optim.

**Author(s)**

Reinhard Furrer

**See Also**

covmat

**Examples**

```r
# True parameter values:
truebeta <- c(1,2,.2)  # beta = (intercept, linear in x, linear in y)
truetheta <- c(.5,2,.02)  # theta = (range, sill, nugget)

# We now define a grid, distance matrix, and a sample:
x <- seq(0,1,l=5)
locs <- expand.grid( x, x)
X <- as.matrix( cbind(locs))  # design matrix

distmat <- nearest.dist( locs, upper=NULL)  # distance matrix
Sigma <- cov.sph( distmat, truetheta)  # true covariance matrix

set.seed(15)
y <- c(rmvnorm.spam(1, X %*% truebeta,Sigma))  # construct sample

# Here is the negative 2 log likelihood:
neg2loglikelihood.spam( y, X, distmat, cov.sph, 
truebeta, truetheta, thetalower=c(0,0,0), thetaupper=c(1,Inf,Inf))

# We pass now to the mle:
res <- mle.spam(y, X, distmat, cov.sph, 
truebeta, truetheta, thetalower=c(0,0,0), thetaupper=c(1,Inf,Inf))

# Similar parameter estimates here, of course:
mle.nomean.spam(y=X%*%res$par[1:3], distmat, cov.sph, 
truetheta, thetalower=c(0,0,0), thetaupper=c(1,Inf,Inf))
```
**nearestdist**

**Distance Matrix Computation**

**Description**

This function computes and returns specific elements of distance matrix computed by using the specified distance measure.

**Usage**

```r
nearest.dist( x, y=NULL, method = "euclidean",
              delta = 1, upper = if (is.null(y)) FALSE else NULL,
              p=2, miles=TRUE, R=NULL)
```

**Arguments**

- `x`: Matrix of first set of locations where each row gives the coordinates of a particular point. See also 'Details'.
- `y`: Matrix of second set of locations where each row gives the coordinates of a particular point. If this is missing `x` is used. See also 'Details'.
- `method`: the distance measure to be used. This must be one of "euclidean", "maximum", "minkowski" or "greatcircle". Any unambiguous substring can be given.
- `delta`: only distances smaller than `delta` are recorded, see Details.
- `upper`: Should the entire matrix (NULL) or only the upper-triagonal (TRUE) or lower-triagonal (FALSE) values be calculated.
- `p`: The power of the Minkowski distance.
- `miles`: For great circle distance: If true distances are in statute miles if false distances in kilometers.
- `R`: For great circle distance: Radius to use for sphere to find spherical distances. If `NULL` the radius is either in miles or kilometers depending on the values of the miles argument. If `R=1` then distances are of course in radians.

**Details**

For great circle distance, the matrices `x` and `y` contain the degrees longitudes in the first and the degrees latitudes in the second column. `eps` and `delta` are in degrees. Hence to restrict to distances smaller than `delta.km`, one has to specify `delta=delta.km*360/(6378.388*2*pi)`.

The distances are calculated based on spherical law of cosines. Care is needed for ‘zero’ distances due to the final acosin: acos(1-1e-16), especially with an actual radius.

Default value of Earth’s radius is 3963.34miles (6378.388km).

There are many other packages providing distance functions. Especially for great circle distances there are considerable differences between the implementations. For high precision results, `sp::spDists`
is a good candidate.

The formerly depreciated arguments eps and diag are now eliminated. 
x and y can be any object with an existing as.matrix method.

The Fortran code is based on a idea of Doug Nychka.

Value

A spam object containing the distances spanned between zero and delta. The sparse matrix may 
contain many zeros (e.g., collocated data). However, to calculate covariances, these zeros are es-

spam_rdist

Examples

# Note that upper=T and using t(X)*X is quicker than upper=NULL;
# upper=T marginally slower than upper=F.

# To compare nearest.dist with dist, use as.dist(...)
 nx <- 4
 x <- expand.grid(as.double(1:nx),as.double(1:nx))
 sum( ( as.dist(nearest.dist( x, delta=nx*2))- 
       dist(x) )^2)

# Create nearest neighbor structures:
 par(mfcol=c(1,2))
 x <- expand.grid(1:nx,1:(2*nx))
 display( nearest.dist( x, delta=1))
 x <- expand.grid(1:(2*nx),1:nx)
 display( nearest.dist( x, delta=1))

Description

Allow the user to set and examine a variety of options which affect the way in which R computes 
and displays sparse matrix results.
**Details**

Invoking `options()` with no arguments returns a list with the current values of the options. To access the value of a single option, one should use `getOption("spam.eps")`, e.g., rather than `options("spam.eps")` which is a list of length one.

Of course, printing is still subordinate to `getOption("max.print")` or similar options.

**Value**

For `getOption`, the current value set for option `x`, or `NULL` if the option is unset.

For `options()`, a list of all set options sorted by category. For `options(name)`, a list of length one containing the set value, or `NULL` if it is unset. For uses setting one or more options, a list with the previous values of the options changed (returned invisibly).

**Options used**

A short description with the default values follows.

- `spam.eps= .Machine$double.eps`: values smaller than this are considered as zero. This is only used when creating spam objects.
- `spam.drop=FALSE`: default parameter for `drop` when subsetting
- `spam.printsize=100`: the max number of elements of a matrix which we display as regular matrix.
- `spam.imagesize=10000`: the max number of elements of a matrix we display as regular matrix with `image` or `display`. Larger matrices are represented as dots only.
- `spam.cex=1200`: default dot size for `image` or `display`.
- `spam.structurebased=FALSE`: should operations be carried out on the nonzero entries (the structure) or including the zeros.
- `spam.inefficiencywarning=1e6`: issue a warning when inefficient operations are performed and the matrix exceeds the specified size. Valid value is a positive integer or a logical. `TRUE` corresponds to 1 (always), `FALSE` to `Inf`.
- `spam.trivalues=FALSE`: a flag whether to return the structure (`FALSE`) or the values themselves (`TRUE`) when returning the upper and lower triangular part of a matrix.
- `spam.listmethod="PE"`: algorithm for `spam.list`. Default is suggestion by Paul Eilers (thanks). Any other specification uses a bubble sort algorithm which is only slightly faster for very sparse matrices.
- `spam.dopivoting=TRUE`: default parameter for "solve" routines. `FALSE` would solve the system without using the permutation.
- `spam.NAOK=FALSE`: logical determines if NA, NaN and Inf are allowed to Fortan. Setting to `TRUE` allows to work with these but full functionality has not been tested.
- `spam.safemodevalidity=TRUE`: logical determines if sanity check is performed when constructing sparse matrices. Default is safer but somewhat slower.
- `spam.cholsymmetrycheck=TRUE`: for the Cholesky factorization, verify if the matrix is symmetric.
spam.cholpivotcheck=TRUE: for the Cholesky factorization, when passing a permutation, should a minimum set of checks be performed?

spam.cholupdatesingular="warning": for a Cholesky update, what happens if the matrix is singular: "warning" only and returning the not updated factor, "error" or return simply "NULL".

spam.cholincreasefactor=c(1.25,1.25): If not enough memory could be allocated, these are the steps to increase it.

spam.nnznearestdistnnz=c(400*2,400): Memory allocation parameters for nearest.dist.

spam.nearestdistincreasefactor=1.25: If not enough memory could be allocated, this is the step to increase it.

**Description**

Oral cavity cancer counts in 544 districts in Germany over 1986-1990.

**Format**

Oral is a dataframe with 3 columns.

- **Y** observed counts
- **E** expected counts
- **SMR** standardized mortality ratios

Germany is a list of 544 elements, each describing an individual polygon of the district.

**Details**

The expected counts depend on the number of people in the region and their age distribution. The regions are ordered according the supplied polygon description and adjacency graph.

There is a similar dataset data(Germany) with larynx cancer cases from the package INLA as well, with an additional smoking covariate.

**Source**

The data is available from the package INLA distributed from [www.r-inla.org](http://www.r-inla.org).

**References**

**See Also**

germany.plot.
ordering  

Extract the permutation

Description

Extract the (inverse) permutation used by the Cholesky decomposition

Usage

ordering( x, inv=FALSE)

Arguments

x object of class spam.chol.method returned by the function chol.
inv Return the permutation (default) or inverse thereof.

Details

Recall that calculating a Cholesky factor from a sparse matrix consists of finding a permutation first, then calculating the factors of the permuted matrix. The ordering is important when working with the factors themselves.

The ordering from a full/regular matrix is 1:n.

Note that there exists many different algorithms to find orderings.

See the examples, they speak more than 10 lines.

chol.spam, solve.spam.

Examples

# Construct a pd matrix S to work with (size n)
> n <- 100  # dimension
> S <- .25 * abs(outer(1:n,1:n,"-"))
> S <- as.spam( S, eps=1e-4)
> I <- diag(n)  # Identity matrix

> cholS <- chol( S)
> ord <- ordering(cholS)
> iord <- ordering(cholS, inv=TRUE)
R <- as.spam( cholS ) # R'R = P S P', with P=I[ord,],
# a permutation matrix (rows permuted).
RtR <- t(R) %*% R

# the following are equivalent:
as.spam( RtR -
 S[ord,ord] )
as.spam( RtR[iord,iord] - S )
as.spam( t(R[,iord]) %*% R[,iord] - S )

# trivially:
as.spam( t(I[iord,]) - I[ord,]) # (P^-1)' = P
as.spam( t(I[ord,]) - I[,ord]) #
as.spam( I[iord,] - I[,ord])
as.spam( I[ord,]%*%S%*%I[,ord] - S[ord,ord] )
  # pre and post multiplication with P and P' is ordering

---

**pad**

*Padding a (sparse) matrix*

---

**Description**

Resets the dimension of a (spam) matrix by truncation or zero padding.

**Usage**

```r
pad(x) <- value
```

**Arguments**

- **x**  
  a spam matrix

- **value**  
  A numeric two-vector.

**Details**

It is important to notice the different behavior of the replacement method for ordinary arrays and spam objects (see ‘Examples’). Here, the elements are not simply rearranged but an entirely new matrix is constructed. If the new column dimension is smaller than the original, the matrix is also cleaned (with option("spam.eps") as filter).

**Value**

A (spam) matrix of dimension value where truncation or padding has been used.

**Author(s)**

Reinhard Furrer
permutation

See Also

dim.spam.

Examples

```r
x <- diag(4)
dim(x)<-c(2,8)
x

s <- diag.spam(4)
pad(s) <- c(7,3)  # any positive value can be used

s <- diag.spam(4)
pad(s) <- c(2,8)  # result is different than x
```

Description

Row and/or column permutes a matrix.

Usage

`permutation.spam(A, P=NULL, Q=NULL, ind=FALSE, check=TRUE)`

Arguments

- `A`: sparse matrix
- `P`: vector giving the row permutation.
- `Q`: vector giving the column permutation.
- `ind`: are the indices given. See examples.
- `check`: Should rudimentary checks be performed.

Details

If P and Q are permutation matrices, the result is PAQ. However, it is also possible to specify the indices and to perform in a very efficient way `A[rowind, colind]`, see examples.

A row permutation is much faster than a column permutation. For very large matrices, a double transpose might be faster.

The spam option `spam.checkpivot` determines if the permutation is verified.

Value

A permuted matrix.

precemat  

---

**IGMRF Precision Matrices**

**Description**

Fast ways to create sparse precision matrices for various IGMRF.

**Usage**

```r
precemat(n, season=12, m=n, A=NULL, order=1, ..., type="RW1")
precemat.RW1(n)
precemat.RW2(n)
precemat.RWn(n, order=3)
precemat.season(n, season=12)
precemat.IGMRFreglat(n, m, order=1, anisotropy=1)
precemat.IGMRFirreglat(A, eps=getOption("spam.pts"))
```

**Arguments**

- `n`: dimension of the field.
- `type`: the type of the IGMRF.
- `season`: length of season.
- `m`: second dimension (in case of a regular lattice).
- `A`: adjacency matrix (see below).
- `order`: order for higher order RWs.
- `anisotropy`: anisotropy factor, between 0 and 2.
- `eps`: tolerance level.
- `...`: arguments passed to individual functions.

**Details**

precemat is a wrapper that calls the other functions according to the argument type. Implements many of the precision matrices discussed in Chapter 3 of Rue and Held (2005). For example, precemat.RW1, precemat.RW2 and precemat.season are given in equations (3.22), (3.40) and (3.59); precemat.IGMRFreglat on page 107. Note that for the latter we reverse the order of the dimension here!

If adjacency matrix is a regular matrix, it is coerced to a spam object. Only the structure is used. Make sure, that the diagonal is empty.

**Value**

A sparse precision matrix.

**Author(s)**

Reinhard Furrer
References
Rue and Held (2005).

See Also
precmat.GMRFreglat, rmvnorm.prec, adjacency.landkreis.

Examples
n <- 10
Q <- precmat.RW2(n)
# rmvnorm.prec(1, Q=Q) # does not work, because the matrix is singular.

print

Printing and summarizing sparse matrices

Description
Printing (non-zero elements) of sparse matrices and summarizing the sparsity structure thereof.

Usage

## S4 method for signature 'spam'
print(x, ...)   
## S4 method for signature 'spam'
summary(object, ...)

Arguments

x          matrix of class spam or spam.chol.method.
object     matrix of class spam or spam.chol.method.
...        any other arguments passed to print.default.

Details

getOption('spam.printsize') determines if the sparse matrix is coerced into a matrix and the
printed as an array or if only the non-zero elements of the matrix are given.

Value

NULL for print, because the information is printed with cat there is no real need to pass any object
back.

A list containing the non-zero elements and the density for summary for class spam.

A list containing the non-zero elements of the factor, the density and the fill-in for summary for class
spam.chol.NgPeyton.
Author(s)

Reinhard Furrer

print(smat)
options(spam.printsize=10)
print(smat)
summary(smat)
(summary(smat))
```

\section*{rmvnorm} \hfill \textit{Draw Multivariate Normals}

Description

Fast ways to draw multivariate normals when the variance or precision matrix is sparse.

Usage

\begin{verbatim}
rmvnorm.spam(n,mu=rep.int(0, dim(Sigma)[1]), Sigma, Rstruct=NULL, ...)
rmvnorm.prec(n,mu=rep.int(0, dim(Q)[1]), Q, Rstruct=NULL, ...)
rmvnorm.canonical(n, b, Q, Rstruct=NULL, ...)
\end{verbatim}

Arguments

\begin{itemize}
  \item \textbf{n} \hspace{1cm} number of observations.
  \item \textbf{mu} \hspace{1cm} mean vector.
  \item \textbf{Sigma} \hspace{1cm} covariance matrix of class \texttt{spam}.
  \item \textbf{Q} \hspace{1cm} precision matrix.
  \item \textbf{b} \hspace{1cm} vector determining the mean.
  \item \textbf{Rstruct} \hspace{1cm} the Cholesky structure of \texttt{Sigma} or \texttt{Q}.
  \item \textbf{...} \hspace{1cm} arguments passed to \texttt{chol}.
\end{itemize}
Details

The functions \texttt{rmvnorm\_prec} and \texttt{rmvnorm\_canonical} do not require sparse precision matrices. For \texttt{rmvnorm\_spam}, the differences between regular and sparse covariance matrices are too significant to be implemented here.

Often (e.g., in a Gibbs sampler setting), the sparsity structure of the covariance/precision does not change. In such setting, the Cholesky factor can be passed via \texttt{Rstruct} in which only updates are performed (i.e., \texttt{update\_spam\_chol\_NgPeyton} instead of a \texttt{chol}).

Examples

\begin{verbatim}
# Generate multivariate from a covariance inverse:
# (usefull for GRMF)
set.seed(13)
n <- 25      # dimension
N <- 1000    # sample size
Sigmainv <- .25*abs(outer(1:n,1:n,"-"))
Sigmainv <- as.spam( Sigmainv, eps=1e-4)

Sigma <- solve( Sigmainv) # for verification
iidsample <- array(rnorm(N*n),c(n,N))
mvsample <- backsolve( chol(Sigmainv), iidsample)
norm( var(t(mvsample)) - Sigma, type="m")

# compare with:
mvsample <- backsolve( chol(as.matrix( Sigmainv)), iidsample, n)
#### ,n as patch
norm( var(t(mvsample)) - Sigma, type="m")

# 'solve' step by step:
b <- rnorm( n)
R <- chol(Sigmainv)
norm( backsolve( R, forwardsolve( R, b))- solve( Sigmainv, b) )
norm( backsolve( R, forwardsolve( R, diag(n)))- Sigma )
\end{verbatim}
rmvnorm.const  Draw Constrained Multivariate Normals

Description

Fast ways to draw multivariate normals with linear constrains when the variance or precision matrix is sparse.

Usage

```r
rmvnorm.const(n, mu = rep.int(0, dim(Sigma)[1]), Sigma, Rstruct = NULL,
A = array(1, c(1,dim(Sigma)[1])), a=0, U=NULL, ...)
rmvnorm.prec.const(n, mu = rep.int(0, dim(Q)[1]), Q, Rstruct = NULL,
A = array(1, c(1,dim(Q)[1])), a=0, U=NULL, ...)
rmvnormcanonical.const(n, b, Q, Rstruct = NULL,
A = array(1, c(1,dim(Q)[1])), a=0, U=NULL, ...)
```

Arguments

- `n` number of observations.
- `mu` mean vector.
- `Sigma` covariance matrix of class spam.
- `Q` precision matrix.
- `b` vector determining the mean.
- `Rstruct` the Cholesky structure of Sigma or Q.
- `A` Constrain matrix.
- `a` Constrain vector.
- `U` see below.
- `...` arguments passed to chol.

Details

The functions `rmvnorm.prec` and `rmvnormcanonical` do not require sparse precision matrices. For `rmvnorm.spam`, the differences between regular and sparse covariance matrices are too significant to be implemented here.

Often (e.g., in a Gibbs sampler setting), the sparsity structure of the covariance/precision does not change. In such setting, the Cholesky factor can be passed via `Rstruct` in which only updates are performed (i.e., `update.spam.chol.Ng Peyton` instead of a full `chol`).

rowSums  

**Form Row and Column Sums and Means**

Description

Form row and column sums and means for sparse spam matrices

Usage

rowSums(x, na.rm = FALSE, dims = 1, ...)
colSums(x, na.rm = FALSE, dims = 1, ...)
rowMeans(x, na.rm = FALSE, dims = 1, ...)
colMeans(x, na.rm = FALSE, dims = 1, ...)

Arguments

x  
a spam object
na.rm  
currently ignored
dims  
ignored as we have only two dimensions.
...  
potentially further arguments from other methods.

Details

Depending on the flag .

Value

Vector of appropriate length.

Author(s)

Reinhard Furrer

See Also

apply.spam, spam.options.
Examples

```r
x <- spam( rnorm(20), 5, 4)
rowSums(x)
c( x %*% rep(1,4))
```

Description

These functions are convenient wrappers for `spam` objects to classical matrix operations.

Usage

```r
var.spam(x, ...)
```

## S3 method for class 'spam'

```r
var(x, ...)
```

Arguments

- `x` : matrix of class `spam`.
- `...` : further arguments passed to or from other methods.

Details

There is probably no point in fully defining methods here. Typically, these functions do not exploit sparsity structures. Hence, for very large matrices, warnings may be posted.

Value

Depends on function...

Author(s)

Reinhard Furrer

See Also

Option "inefficiencywarning" in `spam.options`
Sparse Matrix Class

Description

This group of functions evaluates and coerces changes in class structure.

Usage

spam(x, nrow = 1, ncol = 1, eps = getOption("spam.eps"))

as.spam(x, eps = getOption("spam.eps"))

is.spam(x)

Arguments

x is a matrix (of either dense or sparse form), a list, vector object or a distance object
nrow number of rows of matrix
ncol number of columns of matrix
eps A tolerance parameter: elements of x such that abs(x) < eps set to zero. Defaults to eps = getOption("spam.eps")

Details

The functions spam and as.spam act like matrix and as.matrix to coerce an object to a sparse matrix object of class spam.

If x is a list, it should contain either two or three elements. In case of the former, the list should contain a n by two matrix of indices (called ind) and the values. In case of the latter, the list should contain three vectors containing the row, column indices (called i and j) and the values. In both cases partial matching is done. In case there are several triplets with the same i, j, the values are added.

eps should be at least as large as .Machine$double.eps.

If getOption("spam.force64") is TRUE, a 64-bit spam matrix is returned in any case. If FALSE, a 32-bit matrix is returned when possible.

Value

A valid spam object.

is.spam returns TRUE if x is a spam object.
Note

The zero matrix has the element zero stored in (1,1).

The functions do not test the presence of NA/NaN/Inf. Virtually all call a Fortran routine with the NAOK=NAOK argument, which defaults to FALSE resulting in an error. Hence, the NaN do not always properly propagate through (i.e. spam is not IEEE-754 compliant).

Author(s)

Reinhard Furrer

References

See Also

SPAM for a general overview of the package; spam.options for details about the safemode flag; read.MM and foreign to create spam matrices from MatrixMarket files and from certain Matrix or SparseM formats.

Examples

# old message, do not loop, when you create a large sparse matrix
set.seed(13)
nz <- 128
ln <- nz^2
smat <- spam(0,ln,ln)
is <- sample(ln,nz)
js <- sample(ln,nz)
system.time(for (i in 1:nz) smat[is[i], js[i]] <- i)
system.time(smat[cbind(is,js)] <- 1:nz)

getClass("spam")

options(spam.NAOK=TRUE)
as.spam(c(1, NA))
Details

Linear algebra operations for matrices of class spam are designed to behave exactly as for regular matrices. In particular, matrix multiplication, transpose, addition, subtraction and various logical operations should work as with the conventional dense form of matrix storage, as does indexing, rbind, cbind, and diagonal assignment and extraction (see for example diag). Further functions with identical behavior are dim and thus nrow, ncol.

The function norm calculates the (matrix-)norm of the argument. The argument type specifies the 11 norm, sup or max norm (default), or the Frobenius or Hilbert-Schmidt (frobenius hs) norm. Partial matching can be used. For example, norm is used to check for symmetry in the function chol by computing the norm of the difference between the matrix and its transpose.

The operator %*% efficiently multiplies a diagonal matrix (in vector form) and a sparse matrix and is used for compatibility with the package fields. More specifically, this method is used in the internal functions of krig to make the code more readable. It avoids having a branch in the source code to handle the diagonal or nondiagonal cases. Note that this operator is not symmetric: a vector in the left argument is interpreted as a diagonal matrix and a vector in the right argument is kept as a column vector.

The operator %+% efficiently adds a diagonal matrix (in vector form) and a sparse matrix, similarly to the operator %*%.

spam for coercion and other class relations involving the sparse matrix classes.

Examples

```r
# create a weight matrix and scale it:
## Not run:
wij <- distmat
# with distmat from a nearest.dist(..., upper=TRUE) call

n <- dim(wij)[1]

wij@entries <- kernel( wij@entries, h) # for some function kernel
wij <- wij + t(wij) + diag.spam(n) # adjust from diag=FALSE, upper=TRUE

sumwij <- wij %*% rep(1,n)
# row scaling:
# wij@entries <- wij@entries/sumwij[ wij@colindices]
# col scaling:
wij@entries <- wij@entries/sumwij[ rep(1:n, diff(wij@rowpointers))]

## End(Not run)
```
**Description**

backsolve and forwardsolve solve a system of linear equations where the coefficient matrix is upper or lower triangular.

solve solves a linear system or computes the inverse of a matrix if the right-hand-side is missing.

**Usage**

```r
## S4 method for signature 'spam'
solve(a, b, Rstruct=NULL, ...)
## S4 method for signature 'spam'
backsolve(r, x, ...)
## S4 method for signature 'spam'
forwardsolve(l, x, ...)
## S4 method for signature 'spam'
chol2inv(x, ...)
```

**Arguments**

- `a`  
  symmetric positive definite matrix of class `spam` or a Cholesky factor as the result of a chol call.

- `l, r`  
  object of class `spam` or `spam.chol` method returned by the function chol.

- `x, b`  
  vector or regular matrix of right-hand-side(s) of a system of linear equations.

- `Rstruct`  
  the Cholesky structure of `a`.

- `...`  
  further arguments passed to or from other methods, see ‘Details’ below.

**Details**

We can solve \( A \times x = b \) by first computing the Cholesky decomposition \( A = t(R) \times t(R) \), then solving \( t(R) \times y = b \) for \( y \), and finally solving \( R \times x = y \) for \( x \). solve combines chol, a Cholesky decomposition of a symmetric positive definite sparse matrix, with forwardsolve and then backsolve.

In case `a` is from a chol call, then solve is an efficient way to calculate backsolve(`a, forwardsolve(t(a), b)`).

However, for `a.spam` and `a.mat` from a chol call with a sparse and ordinary matrix, note that

```r
forwardsolve(a.mat, b, transpose=T, upper.tri=T)
```

is equivalent to

```r
forwardsolve(t(a.mat), b)
```

and

```r
backsolve(a.spam, forwardsolve(a.spam, b, transpose=T, upper.tri=T))
```

yields the desired result. But

```r
backsolve(a.spam, forwardsolve(t(a.spam), resid))
```

is wrong because \( t(a.spam) \) is a spam and not a spam.chol.NgPeyton object.

forwardsolve and backsolve solve a system of linear equations where the coefficient matrix is lower (forwardsolve) or upper (backsolve) triangular. Usually, the triangular matrix is result
from a chol call and it is not required to transpose it for forward.solve. Note that arguments of the
default methods k, upper.tri and transpose do not have any effects here.

Notice that it is more efficient to solve successively the linear equations (both triangular solves)
then to implement these in the Fortran code.

If the right-hand-side in solve is missing it will compute the inverse of a matrix. For details about
the specific Cholesky decomposition, see chol.

Recall that the Cholesky factors are from ordered matrices.

chol2inv(x) is a faster way to solve(x).

Note

There is intentionally no S3 distinction between the classes spam and spam.chol.method.

Sigmainv <- as.spam(Sigmainv, eps=1e-4)

Sigma <- solve(Sigmainv)  # for verification
iidsample <- array(rnorm(N*n),c(n,N))
mvsample <- backsolve(chol(Sigmainv), iidsample)
norm( var(t(mvsample)) - Sigma)

# compare with:
mvsample <- backsolve(chol(as.matrix(Sigmainv)), iidsample, n)
### ,n as patch
norm( var(t(mvsample)) - Sigma)

# 'solve' step by step:
b <- rnorm(n)
R <- chol(Sigmainv)
norm( backsolve( R, forwardsolve( R, b)) - solve( Sigmainv, b) )
norm( backsolve( R, forwardsolve( R, diag(n)) - Sigma )

# 'update':
R1 <- update( R, Sigmainv + diag.spam(n))

---

### spam-class

**Class** "spam"

**Description**

The spam class is a representation of sparse matrices.

**Objects from the Class**

Objects can be created by calls of the form `new("spam", entries, colindices, rowpointes, dimension)`. The standard "old Yale sparse format" is used to store sparse matrices. The matrix x is stored in row form. The first element of row i is `x[rowpointers[i]]`. The length of row i is determined by `x[rowpointers[i+1]] - x[rowpointers[i]]`. The column indices of x are stored in the `x@colindices` vector. The column index for element `x[entries[k]]` is `x@colindices[k]`.

**Slots**

- **entries**: Object of class "numeric" contains the nonzero values.
- **colindices**: Object of class "integer" ordered indices of the nonzero values.
- **rowpointers**: Object of class "integer" pointer to the beginning of each row in the arrays entries and colindices.
- **dimension**: Object of class "integer" specifying the dimension of the matrix.

**Methods**

- **as.matrix** signature(x = "spam"): transforming a sparse matrix into a regular matrix.
- **as.vector** signature(x = "spam"): transforming a sparse matrix into a vector (depending on structure based) see as.vector.spam for details.
- **as.spam** signature(x = "spam"): cleaning of a sparse matrix.
- **[<** signature(x = "spam", i, j, value): assigning a sparse matrix. The negative vectors are not implemented yet.
[ signature(x = "spam", i, j): subsetting a sparse matrix. The negative vectors are not implemented yet.

%*% signature(x, y): matrix multiplication, all combinations of sparse with full matrices or vectors are implemented.

c signature(x = "spam"): vectorizes the sparse matrix and takes account of the zeros. Hence the length of the result is \( \text{prod(dim(x))} \).

cbind signature(x = "spam"): binds sparse matrices, see cbind for details.

chol signature(x = "spam"): see chol for details.

diag signature(x = "spam"): see diag for details.

dim<- signature(x = "spam"): rearranges the matrix to reflect a new dimension.

dim signature(x = "spam"): gives the dimension of the sparse matrix.

pad<- signature(x = "spam"): truncates or augments the matrix see dim for details.

image signature(x = "spam"): see image for details.

display signature(x = "spam"): see display for details.

length<- signature(x = "spam"): Is not implemented and causes an error.

length signature(x = "spam"): gives the number of non-zero elements.

lower.tri signature(x = "spam"): see lower.tri for details.

Math signature(x = "spam"): see Math for details.

Math2 signature(x = "spam"): see Math2 for details.

norm signature(x = "spam"): calculates the norm of a matrix.

plot signature(x = "spam", y): same functionality as the ordinary plot.

print signature(x = "spam"): see print for details.

rbind signature(x = "spam"): binds sparse matrices, see cbind for details.

solve signature(a = "spam"): see solve for details.

summary signature(object = "spam"): small summary statement of the sparse matrix.

Summary signature(x = "spam"): All functions of the Summary class (like min, max, range...) operate on the vector x@entries and return the result thereof. See Examples or Summary for details.

t signature(x = "spam"): transpose of a sparse matrix.

upper.tri signature(x = "spam"): see lower.tri for details.

Details

The compressed sparse row (CSR) format is often described with the vectors a, ia, ja. To be a bit more comprehensive, we have chosen longer slot names.

Note

The slots colindices and rowpointers are tested for proper integer assignments. This is not true for entries.

Deprecated, Defunct
Class "spam.chol.NgPeyton"

Description

Result of a Cholesky decomposition with the NgPeyton method

Objects from the Class

Objects are created by calls of the form chol(x, method="NgPeyton", ...) and should not be created directly with a new("spam.chol.NgPeyton", ...) call.
At present, no proper print method is defined. However, the factor can be transformed into a spam object.

Methods

- **as.matrix** signature(x = "spam.chol.NgPeyton"): Transform the factor into a regular matrix.
- **as.spam** signature(x = "spam.chol.NgPeyton"): Transform the factor into a spam object.
- **backsolve** signature(r = "spam.chol.NgPeyton"): solving a triangular system, see solve.
- **forwardsolve** signature(l = "spam.chol.NgPeyton"): solving a triangular system, see solve.
- **c** signature(x = "spam.chol.NgPeyton"): Coerce the factor into a vector.
- **determinant** signature(x = "spam.chol.NgPeyton"): Calculates the determinant from the factor, see also det.
- **diag** signature(x = "spam.chol.NgPeyton"): Extracts the diagonal entries.
- **dim** signature(x = "spam.chol.NgPeyton"): Retrieve the dimension. Note that "dim<-" is not implemented.
- **display** signature(x = "spam.chol.NgPeyton"): Transformation to a spam object and display, see also display.
- **image** signature(x = "spam.chol.NgPeyton"): Transformation to a spam object and display, see also image.
- **length** signature(x = "spam.chol.NgPeyton"): Retrieve the dimension. Note that "length<-" is not implemented.
- **ordering** signature(x = "spam.chol.NgPeyton"): Retrieves the ordering, in ordering.
- **print** signature(x = "spam.chol.NgPeyton"): Short description.
- **show** signature(object = "spam.chol.NgPeyton"): Short description.
- **summary** signature(object = "spam.chol.NgPeyton"): Description of the factor, returns (as a list) nnzR, nnzcolindices, the density of the factor density, and fill-in ratio fillin. For the use of the first two, see 'Examples' in chol.
- **t** signature(x = "spam.chol.NgPeyton"): Transformation to a spam object and transposition.
- **chol** signature(x = "spam.chol.NgPeyton"): Returns x unchanged.

`print.spam` ordering and `chol`

Examples
```r
x <- spam(c(4, 3, 0, 3, 5, 1, 0, 1, 4), 3)
cf <- chol(x)
cf
as.spam(cf)

# Modify at own risk...
slotNames(cf)
```

Summary

**Rounding of Numbers**

Description
Applies the Math2 group functions to spam objects

Usage
```r
# max(x, ..., na.rm = FALSE)
```

Arguments

- `x` spam object.
- `na.rm` a logical indicating whether missing values should be removed.

Details
The `na.rm` argument is only meaningful if `NAOK=TRUE`

Value
If `structurebased=TRUE`, all functions operate on the vector `x@entries` and return the result thereof.
Conversely, if `structurebased=FALSE`, the result is identical to one with `as.matrix(x)` input.
toeplitz

Examples

getGroupMembers("Summary")

smat <- diag.spam( runif(15))
range(smat)
options(spam.structurebased=FALSE)
range(smat)

## Not run:
max( log(spam(c(1,-1))), na.rm=TRUE)

## End(Not run)
# allow 'NA's first:
# TODO
# options(spam.NAOk=TRUE)
# max( log(spam(c(1,-1))), na.rm=TRUE)

toeplitz Create Toeplitz Matrices

Description

Creates symmetric and asymmetric Toeplitz matrices.

Usage

toeplitz.spam(x, y = NULL, eps = getOption("spam.eps"))

Arguments

x the first row to form the Toeplitz matrix.
y for asymmetric Toeplitz matrices, this contains the first column.
eps A tolerance parameter: elements of x such that abs(x) <= eps set to zero. Defaults to eps = getOption("spam.eps").

Details

The vector y has to be of the same length as x and its first element is discarded.
Value
The Toeplitz matrix in spam format.

Author(s)
Reinhard Furrer

See Also
toeplitz, circulant.spam

Examples
toeplitz.spam(c(1,25,0,0,0))

Description
Returns a list containing the indices and elements of a spam object.

Usage
triplet(x, tri=FALSE)

Arguments
x     sparse matrix of class spam or a matrix.
tri    Boolean indicating whether to create individual row and column indices vectors.

Details
The elements are row (column) first if x is a spam object (matrix).

Value
A list with elements
indices    a by two matrix containing the indices if tri=FALSE.
i,j        vectors containing the row and column indices if tri=TRUE.
values     a vector containing the matrix elements.

Author(s)
Reinhard Furrer
UScounties

Description

First and second order adjacency structure of the counties in the contiguous United States. We consider that two counties are neighbors if they share at least one edge of their polygon description in maps.

Format

Two matrices of class spam

UScounties.storder Contains a one in the i and j element if county i is a neighbor of county j.

UScounties.ndorder Contains a one in the i and j element if counties i and j are neighbors of county k and counties i and j are not neighbors.

See Also

map from maps.

Examples

# number of counties:
n <- nrow(UScounties.storder)

## Not run:
# make a precision matrix
Q <- diag.spam(n) + .2 * UScounties.storder + .1 * UScounties.ndorder
display(as.spam(chol(Q)))

## End(Not run)

spam.list for the inverse operation and foreign for other transformations.
USprecip Monthly total precipitation (mm) for April 1948 in the contiguous United States

Description

This is a useful spatial data set of moderate to large size consisting of 11918 locations. See www.image.ucar.edu/GSP/Data/US.monthly.met/ for the source of these data.

Format

This data set is an array containing the following columns:

- **lon,lat**  Longitude-latitude position of monitoring stations
- **raw**  Monthly total precipitation in millimeters for April 1948
- **anomaly**  Precipitation anomaly for April 1948.
- **infill**  Indicator, which station values were observed (5906 out of the 11918) compared to which were estimated.

quilt.plot(USprecip[,1:2],USprecip[,4])
US( add=TRUE, col=2, lty=2)
## End(Not run)
```
validate_spam

Description

Checks if the spam object has the correct structure.

Usage

validate_spam(object)

Arguments

object a spam matrix.

Value

Returns TRUE if object is a valid spam objects.

See Also

spam.creation

Examples

validate_spam(spam(1, 20))

version

Spam Version Information

Description

spam.version is a variable (list) holding detailed information about the version of spam loaded.
spam.Version() provides detailed information about the version of spam running.

Usage

spam.version
Value

spam.version is a list with character-string components

status the status of the version (e.g., "beta")
major the major version number
minor the minor version number
year the year the version was released
month the month the version was released
day the day the version was released

version.string a character string concatenating the info above, useful for plotting, etc.

spam.version is a list of class "simple.list" which has a print method.
