Package ‘sparkxgb’

October 14, 2022

Type Package

Title Interface for 'XGBoost' on 'Apache Spark'

Version 0.1.1

Maintainer Yitao Li <yitao@rstudio.com>

Description A 'sparklyr' <https://spark.rstudio.com/> extension that provides an R interface for 'XGBoost' <https://github.com/dmlc/xgboost> on 'Apache Spark'. 'XGBoost' is an optimized distributed gradient boosting library.

xgboost_classifier  XGBoost Classifier

Description

XGBoost classifier for Spark.

Usage

xgboost_classifier(  
  x,  
  formula = NULL,  
  eta = 0.3,  
  gamma = 0,  
  max_depth = 6,  
  min_child_weight = 1,  
  max_delta_step = 0,  
  grow_policy = "depthwise",  
  max_bins = 16,  
  subsample = 1,  
  colsample_bytree = 1,  
  colsample_bylevel = 1,  
  lambda = 1,  
  alpha = 0,  
  tree_method = "auto",  
  sketch_eps = 0.03,  
  scale_pos_weight = 1,  
  sample_type = "uniform",  
  normalize_type = "tree",  
  rate_drop = 0,  
  skip_drop = 0,  
  lambda_bias = 0,  
  tree_limit = 0,  
  num_round = 1,  
  num_workers = 1,  
  nthread = 1,  
  use_external_memory = FALSE,  
  silent = 0,  
  custom_obj = NULL,  
  custom_eval = NULL,  
  missing = NaN,  
  seed = 0,  
  timeout_request_workers = 30 * 60 * 1000,  
  checkpoint_path = "",  
  checkpoint_interval = -1,  
  objective = "multi:softprob",  
  base_score = 0.5,
xgboost_classifier

train_test_ratio = 1,
num_early_stopping_rounds = 0,
objective_type = "classification",
eval_metric = NULL,
maximize_evaluation_metrics = FALSE,
num_class = NULL,
base_margin_col = NULL,
thresholds = NULL,
weight_col = NULL,
features_col = "features",
label_col = "label",
prediction_col = "prediction",
probability_col = "probability",
raw_prediction_col = "rawPrediction",
uid = random_string("xgboost_classifier_"),
...
)

Arguments

x A spark_connection, ml_pipeline, or a tbl_spark.

formula Used when x is a tbl_spark. R formula as a character string or a formula. This is used to transform the input dataframe before fitting, see ft_r_formula for details.

eta Step size shrinkage used in update to prevents overfitting. After each boosting step, we can directly get the weights of new features and eta actually shrinks the feature weights to make the boosting process more conservative. [default=0.3] range: [0,1]

gamma Minimum loss reduction required to make a further partition on a leaf node of the tree. the larger, the more conservative the algorithm will be. [default=0]

max_depth Maximum depth of a tree, increase this value will make model more complex / likely to be overfitting. [default=6]

min_child_weight Minimum sum of instance weight(hessian) needed in a child. If the tree partition step results in a leaf node with the sum of instance weight less than min_child_weight, then the building process will give up further partitioning. In linear regression mode, this simply corresponds to minimum number of instances needed to be in each node. The larger, the more conservative the algorithm will be. [default=1]

max_delta_step Maximum delta step we allow each tree’s weight estimation to be. If the value is set to 0, it means there is no constraint. If it is set to a positive value, it can help making the update step more conservative. Usually this parameter is not needed, but it might help in logistic regression when class is extremely imbalanced. Set it to value of 1-10 might help control the update. [default=0]

grow_policy Growth policy for fast histogram algorithm.

max_bins Maximum number of bins in histogram.
subsample  Subsample ratio of the training instance. Setting it to 0.5 means that XGBoost randomly collected half of the data instances to grow trees and this will prevent overfitting. [default=1] range:(0,1]

colsample_bytree Subsample ratio of columns when constructing each tree. [default=1] range: (0,1]
colsample_bylevel Subsample ratio of columns for each split, in each level. [default=1] range: (0,1]
lambda L2 regularization term on weights, increase this value will make model more conservative. [default=1]
alpha L1 regularization term on weights, increase this value will make model more conservative, defaults to 0.
tree_method The tree construction algorithm used in XGBoost. options: 'auto', 'exact', 'approx' [default='auto']
sketch_eps This is only used for approximate greedy algorithm. This roughly translated into O(1 / sketch_eps) number of bins. Compared to directly select number of bins, this comes with theoretical guarantee with sketch accuracy. [default=0.03] range: (0, 1)
scale_pos_weight Control the balance of positive and negative weights, useful for unbalanced classes. A typical value to consider: sum(negative cases) / sum(positive cases). [default=1]
sample_type Parameter for Dart booster. Type of sampling algorithm. "uniform": dropped trees are selected uniformly. "weighted": dropped trees are selected in proportion to weight. [default="uniform"]
normalize_type Parameter of Dart booster. type of normalization algorithm, options: 'tree', 'forest'. [default="tree"]
rate_drop Parameter of Dart booster. dropout rate. [default=0.0] range: [0.0, 1.0]
skip_drop Parameter of Dart booster. probability of skip dropout. If a dropout is skipped, new trees are added in the same manner as gbtree. [default=0.0] range: [0.0, 1.0]
lambda_bias Parameter of linear booster L2 regularization term on bias, default 0 (no L1 reg on bias because it is not important.)
tree_limit Limit number of trees in the prediction; defaults to 0 (use all trees.)
num_round The number of rounds for boosting.
num_workers number of workers used to train xgboost model. Defaults to 1.
nthread Number of threads used by per worker. Defaults to 1.
use_external_memory The tree construction algorithm used in XGBoost. options: 'auto', 'exact', 'approx' [default='auto']
silent 0 means printing running messages, 1 means silent mode. default: 0
custom_obj Customized objective function provided by user. Currently unsupported.
custom_eval Customized evaluation function provided by user. Currently unsupported.
**missing**
The value treated as missing. default: Float.NaN

**seed**
Random seed for the C++ part of XGBoost and train/test splitting.

**timeout_request_workers**
the maximum time to wait for the job requesting new workers. default: 30 minutes

**checkpoint_path**
The hdfs folder to load and save checkpoint boosters.

**checkpoint_interval**
Param for set checkpoint interval (>= 1) or disable checkpoint (-1). E.g. 10 means that the trained model will get checkpointed every 10 iterations. Note: checkpoint_path must also be set if the checkpoint interval is greater than 0.

**objective**

**base_score**
Param for initial prediction (aka base margin) column name. Defaults to 0.5.

**train_test_ratio**
Fraction of training points to use for testing.

**num_early_stopping_rounds**
If non-zero, the training will be stopped after a specified number of consecutive increases in any evaluation metric.

**objective_type**
The learning objective type of the specified custom objective and eval. Corresponding type will be assigned if custom objective is defined options: regression, classification.

**eval_metric**
Evaluation metrics for validation data, a default metric will be assigned according to objective(rmse for regression, and error for classification, mean average precision for ranking). options: rmse, mae, logloss, error, merror, mlogloss, auc, aucpr, ndcg, map, gamma-deviance

**maximize_evaluation_metrics**
Whether to maximize evaluation metrics. Defaults to FALSE (for minization.)

**num_class**
Number of classes.

**base_margin_col**
Param for initial prediction (aka base margin) column name.

**thresholds**
Thresholds in multi-class classification to adjust the probability of predicting each class. Array must have length equal to the number of classes, with values > 0 excepting that at most one value may be 0. The class with largest value p/t is predicted, where p is the original probability of that class and t is the class’s threshold.

**weight_col**
Weight column.

**features_col**
Features column name, as a length-one character vector. The column should be single vector column of numeric values. Usually this column is output by ft_r_formula.

**label_col**
Label column name. The column should be a numeric column. Usually this column is output by ft_r_formula.

**prediction_col**
Prediction column name.
xgboost_regressor

probability_col
Column name for predicted class conditional probabilities.

raw_prediction_col
Raw prediction (a.k.a. confidence) column name.

uid
A character string used to uniquely identify the ML estimator.

...
Optional arguments; see Details.

Description
XGBoost regressor for Spark.

Usage
xgboost_regressor(
  x,
  formula = NULL,
  eta = 0.3,
  gamma = 0,
  max_depth = 6,
  min_child_weight = 1,
  max_delta_step = 0,
  grow_policy = "depthwise",
  max_bins = 16,
  subsample = 1,
  colsample_bytree = 1,
  colsample_bylevel = 1,
  lambda = 1,
  alpha = 0,
  tree_method = "auto",
  sketch_eps = 0.03,
  scale_pos_weight = 1,
  sample_type = "uniform",
  normalize_type = "tree",
  rate_drop = 0,
  skip_drop = 0,
  lambda_bias = 0,
  tree_limit = 0,
  num_round = 1,
  num_workers = 1,
  nthread = 1,
  use_external_memory = FALSE,
  silent = 0,
  custom_obj = NULL,
```r
custom_eval = NULL,
missing = NaN,
seed = 0,
timeout_request_workers = 30 * 60 * 1000,
checkpoint_path = "",
checkpoint_interval = -1,
objective = "reg:linear",
base_score = 0.5,
train_test_ratio = 1,
um_early_stopping_rounds = 0,
objective_type = "regression",
eval_metric = NULL,
maximize_evaluation_metrics = FALSE,
base_margin_col = NULL,
weight_col = NULL,
features_col = "features",
label_col = "label",
prediction_col = "prediction",
uid = random_string("xgboost_regressor_"),
...
)
```

**Arguments**

- **x**
  A `spark_connection`, `ml_pipeline`, or a `tbl_spark`

- **formula**
  Used when `x` is a `tbl_spark`. R formula as a character string or a formula. This is used to transform the input dataframe before fitting, see `ft_r_formula` for details.

- **eta**
  Step size shrinkage used in update to prevents overfitting. After each boosting step, we can directly get the weights of new features and eta actually shrinks the feature weights to make the boosting process more conservative. [default=0.3] range: [0,1]

- **gamma**
  Minimum loss reduction required to make a further partition on a leaf node of the tree. the larger, the more conservative the algorithm will be. [default=0]

- **max_depth**
  Maximum depth of a tree, increase this value will make model more complex / likely to be overfitting. [default=6]

- **min_child_weight**
  Minimum sum of instance weight(hessian) needed in a child. If the tree partition step results in a leaf node with the sum of instance weight less than `min_child_weight`, then the building process will give up further partitioning. In linear regression mode, this simply corresponds to minimum number of instances needed to be in each node. The larger, the more conservative the algorithm will be. [default=1]

- **max_delta_step**
  Maximum delta step we allow each tree’s weight estimation to be. If the value is set to 0, it means there is no constraint. If it is set to a positive value, it can help making the update step more conservative. Usually this parameter is not needed, but it might help in logistic regression when class is extremely imbalanced. Set it to value of 1-10 might help control the update. [default=0]
grow_policy Growth policy for fast histogram algorithm.
max_bins Maximum number of bins in histogram.
subsample Subsample ratio of the training instance. Setting it to 0.5 means that XGBoost randomly collected half of the data instances to grow trees and this will prevent overfitting. [default=1] range:(0,1]
colsample_bytree Subsample ratio of columns when constructing each tree. [default=1] range: (0,1]
colsample_bylevel Subsample ratio of columns for each split, in each level. [default=1] range: (0,1]
lambda L2 regularization term on weights, increase this value will make model more conservative. [default=1]
alpha L1 regularization term on weights, increase this value will make model more conservative, defaults to 0.
tree_method The tree construction algorithm used in XGBoost. options: 'auto', 'exact', 'approx' [default='auto']
sketch_eps This is only used for approximate greedy algorithm. This roughly translated into O(1 / sketch_eps) number of bins. Compared to directly select number of bins, this comes with theoretical guarantee with sketch accuracy. [default=0.03] range: (0, 1)
scale_pos_weight Control the balance of positive and negative weights, useful for unbalanced classes. A typical value to consider: sum(negative cases) / sum(positive cases). [default=1]
sample_type Parameter for Dart booster. Type of sampling algorithm. "uniform": dropped trees are selected uniformly. "weighted": dropped trees are selected in proportion to weight. [default="uniform"]
normalize_type Parameter of Dart booster. type of normalization algorithm, options: 'tree', 'forest'. [default="tree"]
rate_drop Parameter of Dart booster. dropout rate. [default=0.0] range: [0.0, 1.0]
skip_drop Parameter of Dart booster. probability of skip dropout. If a dropout is skipped, new trees are added in the same manner as gbtrees. [default=0.0] range: [0.0, 1.0]
lambda_bias Parameter of linear booster L2 regularization term on bias, default 0 (no L1 reg on bias because it is not important.)
tree_limit Limit number of trees in the prediction; defaults to 0 (use all trees.)
num_round The number of rounds for boosting.
num_workers number of workers used to train xgboost model. Defaults to 1.
nthread Number of threads used by per worker. Defaults to 1.
use_external_memory The tree construction algorithm used in XGBoost. options: 'auto', 'exact', 'approx' [default='auto']
silent 0 means printing running messages, 1 means silent mode. default: 0
custom_obj: Customized objective function provided by user. Currently unsupported.
custom_eval: Customized evaluation function provided by user. Currently unsupported.
missing: The value treated as missing. default: Float.NaN
seed: Random seed for the C++ part of XGBoost and train/test splitting.
timeout_request_workers: the maximum time to wait for the job requesting new workers. default: 30 minutes
checkpoint_path: The hdfs folder to load and save checkpoint boosters.
checkpoint_interval: Param for set checkpoint interval (>= 1) or disable checkpoint (-1). E.g. 10 means that the trained model will get checkpointed every 10 iterations. Note: checkpoint_path must also be set if the checkpoint interval is greater than 0.
base_score: Param for initial prediction (aka base margin) column name. Defaults to 0.5.
train_test_ratio: Fraction of training points to use for testing.
num_early_stopping_rounds: If non-zero, the training will be stopped after a specified number of consecutive increases in any evaluation metric.
objective_type: The learning objective type of the specified custom objective and eval. Corresponding type will be assigned if custom objective is defined options: regression, classification.
eval_metric: Evaluation metrics for validation data, a default metric will be assigned according to objective(rmse for regression, and error for classification, mean average precision for ranking). options: rmse, mae, logloss, error, merror, mlogloss, auc, aucpr, ndcg, map, gamma-deviance
maximize_evaluation_metrics: Whether to maximize evaluation metrics. Defaults to FALSE (for minization.)
base_margin_col: Param for initial prediction (aka base margin) column name.
weight_col: Weight column.
features_col: Features column name, as a length-one character vector. The column should be single vector column of numeric values. Usually this column is output by ft_r_formula.
label_col: Label column name. The column should be a numeric column. Usually this column is output by ft_r_formula.
prediction_col: Prediction column name.
uid: A character string used to uniquely identify the ML estimator.
... Optional arguments; see Details.
Details

When \( x \) is a tbl_spark and formula (alternatively, response and features) is specified, the function returns a ml_model object wrapping a ml_pipeline_model which contains data pre-processing transformers, the ML predictor, and, for classification models, a post-processing transformer that converts predictions into class labels. For classification, an optional argument predicted_label_col (defaults to "predicted_label") can be used to specify the name of the predicted label column. In addition to the fitted ml_pipeline_model, ml_model objects also contain a ml_pipeline object where the ML predictor stage is an estimator ready to be fit against data. This is utilized by ml_save with type = "pipeline" to facilitate model refresh workflows.

Value

The object returned depends on the class of \( x \).

- spark_connection: When \( x \) is a spark_connection, the function returns an instance of a ml_estimator object. The object contains a pointer to a Spark Predictor object and can be used to compose Pipeline objects.
- ml_pipeline: When \( x \) is a ml_pipeline, the function returns a ml_pipeline with the predictor appended to the pipeline.
- tbl_spark: When \( x \) is a tbl_spark, a predictor is constructed then immediately fit with the input tbl_spark, returning a prediction model.
- tbl_spark, with formula specified: When formula is specified, the input tbl_spark is first transformed using a RFormula transformer before being fit by the predictor. The object returned in this case is a ml_model which is a wrapper of a ml_pipeline_model.
