Summary of recent updates to \texttt{spatstat}

Adrian Baddeley, Rolf Turner and Ege Rubak

February 21, 2022

This is a summary of changes to the \texttt{spatstat} package that have occurred since the publication of the book [2] in 2015. Since then, the \texttt{spatstat} family has grown by 46\%, including 859 new functions and 6 new datasets, and now contains more than 170,000 lines of code. This document summarises the most important changes.

</table>

2 Package structure

The original spatstat package grew to be very large. It has now been split into a family of packages, to satisfy the requirements of CRAN.

This should not affect the user: existing code will continue to work in the same way.

Typing library(spatstat) will load the familiar spatstat package which can be used as before.

2.1 Sub-packages

Currently there are eight sub-packages, called spatstat.utils, spatstat.data, spatstat.sparse, spatstat.geom, spatstat.random, spatstat.core, spatstat.linnet, and spatstat.

- The spatstat package now contains only documentation and introductory material. It provides beginner’s introductions, vignettes, interactive demonstration scripts, and a few help files summarising the package.
- The spatstat.data package now contains all the datasets for spatstat.
- The spatstat.utils package contains utility functions for spatstat.
- The spatstat.sparse package contains functions for manipulating sparse arrays and performing linear algebra.
- The spatstat.geom package contains definitions of spatial objects (such as point patterns, windows and pixel images) and code which performs geometrical operations.
- The spatstat.random package contains functions for random generation of spatial patterns and random simulation of models.
- The spatstat.core package contains the main code for statistical analysis of spatial point patterns and other spatial data.
- The spatstat.linnet package defines spatial data on a linear network, and performs geometrical operations and statistical analysis on such data.
Installing: If you install `spatstat`, then the system will install all the other sub-packages listed above.

Running: If you type `library(spatstat)` in an R session, the system will automatically load `spatstat.data, spatstat.geom, spatstat.random, spatstat.core and spatstat.linnet`. It will also silently “import” `spatstat.utils` and `spatstat.sparse`. To access the functions in `spatstat.utils` directly, you would need to type `library(spatstat.utils)`. Similarly for `spatstat.sparse`.

2.2 Extension packages

There are also extension packages which provide additional capabilities and must be loaded explicitly when you need them. Currently there are three extension packages, with a fourth in development:

- `spatstat.local` for local model-fitting,
- `spatstat.Knet` provides additional code for analysing point patterns on a network.
- `spatstat.gui` containing interactive graphics functions,
- `spatstat.sphere` for analysing point patterns on a sphere (under development!)

3 Precis of all changes

Here is the text from the ‘overview’ sections of the News and Release Notes for each update.

- New package `spatstat.random`.
- the original `spatstat` package has now been split into 8 sub-packages (`spatstat.utils, spatstat.data, spatstat.sparse, spatstat.geom, spatstat.random, spatstat.core, spatstat.linnet` and `spatstat`).
- The interactive graphics functions `iplot` and `istat` have been removed from `spatstat` into a new extension package `spatstat.gui`.
- The packages `tcltk` and `rpanel` are no longer Suggested by `spatstat`.
- `spatstat` now Imports the package `spatstat.sparse`.
- `spatstat` now Imports the package `spatstat.utils`.
- `spatstat` now requires the package `spatstat.data` which contains the datasets.
- `spatstat` now suggests the package `fftwtools`.
- Conditional simulation in `kppm`.
- More diagnostics for spatial logistic regression models.
- Increased numerical stability in `kppm`.
- Simulation of the product shot noise Cox process.
- Information criteria for model selection in `kppm`.
- Estimation of the spatial covariance function of a pixel image
- Modified handling of covariates in `slrm`
• New options for `weighted.quantile`
• Buffer tessellation
• New function for jittering point patterns on a network.
• Extensions to `rhohat`
• `densityfun.ppp` handles query points outside original window
• Extension to `discretise`.
• Improvement to `densityEqualSplit`.
• Summary method for spatial logistic regression models
• New options for `distmap.psp`
• Improved output in `summary.mppm`
• Increased speed for large datasets.
• Variance calculations handle larger datasets.
• Relative risk estimation on a network.
• Leave-one-out density estimation on a network.
• Add new vertices to a linear network.
• More support for multi-dimensional patterns.
• `predict.mppm` now works for multitype point process models.
• Improved handling of `newdata` in `predict.mppm`
• New datasets `concrete` and `btb`.
• Changed default value of `stringsAsFactors`.
• Function `lengths.psp` has been renamed `lengths_psp`.
• Tessellations on a linear network can now have marks.
• More functions for manipulating tessellations on a linear network.
• New functions for simulating point processes on a linear network.
• Nearest Neighbour Index function can now return mark values.
• Index of repulsion strength for determinantal point process models.
• Nearest neighbours between two point patterns in any number of dimensions.
• More options for handling bad simulation outcomes in `envelope`.
• `mppm` accepts case weights.
• Bandwidth selectors warn about extreme values of bandwidth.
• Fast kernel estimation on a linear network using 2D kernels.
• Extension of Scott’s rule for bandwidth selection.
• Cross-validated bandwidth selection on a linear network.
• Random thinning and random labelling of spatial patterns extended to different types of pattern.
• Confidence intervals for multitype $K$ function.
• Envelopes for balanced two-stage test
• Extensions to adaptive intensity estimators
• ‘Dartboard’ tessellation using polar coordinates.
• Standard error calculation for inverse-distance weighting.
• Kernel estimate of intensity as a $\text{function}(x,y)$.
• Extract discrete and continuous components of a measure.
• Improvements and extensions to leverage and influence code.
• Plot a line segment pattern using line widths.
• Find connected components of each tile in a tessellation.
• Geometrical operations on $\text{distfun}$ objects.
• Join vertices in a linear network.
• Distance map and contact distribution for rectangular structuring element.
• Lurking variable plot for models fitted to several point patterns.
• New dataset $\text{cetaceans}$.
• Gamma correction for colour maps and image plots.
• Class $\text{units}$ has been renamed $\text{unitname}$ to avoid package collision.
• More support for tessellations.
• Fixed longstanding bug in leverage and influence diagnostics.
• Improvements and bug fixes for leverage and influence diagnostics.
• Tighter bounding box for $\text{psp, lpp, linnet}$ objects.
• Improved layout in $\text{plot.solist}$
• Tools to increase colour saturation.
• Connected components of a 3D point pattern.
• Accelerated computations on linear networks.
• Accelerated simulation of determinantal point processes.
• Improved printing of 3D point patterns.
• Minor corrections to handling of unitnames.
• Improvements to ppm and update.ppm.
• Correction to lohboot.
• Numerous bug fixes for linear networks code.
• Now handles disconnected linear networks.
• Effect function is now available for all types of fitted model.
• Geometric-mean smoothing.
• A model can be fitted or re-fitted to a sub-region of data.
• New fast algorithm for kernel smoothing on a linear network.
• Leverage and influence diagnostics extended to Poisson/Gibbs models fitted by logistic composite likelihood.
• Two-stage Monte Carlo test.
• Dirichlet/Voronoi tessellation on a linear network.
• Thinning of point patterns on a linear network.
• More support for functions and tessellations on a linear network.
• Bandwidth selection for pair correlation function.
• Pooling operations improved.
• Operations on signed measures.
• Operations on lists of pixel images.
• Improved pixellation of point patterns.
• Stieltjes integral extended.
• Subset operators extended.
• Greatly accelerated rmh when using nsave.
• Sufficient Dimension Reduction for point processes.
• Alternating Gibbs Sampler for point process simulation.
• New class of spatially sampled functions.
• ROC and AUC extended to other types of point patterns and models.
• More support for linear networks.
• More support for infinite straight lines.
• **spatstat** now depends on the packages **nlme** and **rpart**.

• Important bug fix in **linearK**, **linearpcf**

• Changed internal format of **linnet** and **lpp** objects.

• Faster computation in linear networks.

• Bias correction techniques.

• Bounding circle of a spatial object.

• Option to plot marked points as arrows.

• Kernel smoothing accelerated.

• Workaround for bug in some graphics drivers affecting image orientation.

• Non-Gaussian smoothing kernels.

• Improvements to inhomogeneous multitype $K$ and $L$ functions.

• Variance approximation for pair correlation function.

• Leverage and influence for multitype point process models.

• Functions for extracting components of vector-valued objects.

• Recursive-partition point process models.

• Minkowski sum, morphological dilation and erosion with any shape.

• Minkowski sum also applicable to point patterns and line segment patterns.

• Important bug fix in **Smooth.ppp**

• Important bug fix in spatial CDF tests.

• More bug fixes for replicated patterns.

• Simulate a model fitted to replicated point patterns.

• Inhomogeneous multitype $F$ and $G$ functions.

• Summary functions recognise **correction="all"**

• Leverage and influence code handles bigger datasets.

• More support for pixel images.

• Improved progress reports.

• New dataset **redwood3**

• Fixed namespace problems arising when spatstat is not loaded.

• Important bug fix in leverage/influence diagnostics for Gibbs models.

• Surgery with linear networks.
- Tessellations on a linear network.
- Laslett’s Transform.
- Colour maps for point patterns with continuous marks are easier to define.
- Pair correlation function estimates can be pooled.
- Stipulate a particular version of a package.
- More support for replicated point patterns.
- More support for tessellations.
- More support for multidimensional point patterns and point processes.
- More options for one-sided envelopes.
- More support for model comparison.
- Convexifying operation.
- Subdivide a linear network.
- Penttinen process can be simulated (by Metropolis-Hastings or CFTP).
- Calculate the predicted variance of number of points.
- Accelerated algorithms for linear networks.
- Quadrat counting accelerated, in some cases.
- Simulation algorithms have been accelerated; simulation outcomes are not identical to those obtained from previous versions of spatstat.
- Determinantal point process models.
- Random-effects and mixed-effects models for replicated patterns.
- Dao-Genton test, and corresponding simulation envelopes.
- Simulated annealing and simulated tempering.
- spatstat colour tools now handle transparent colours.
- Improvements to [ and subset methods
- Extensions to kernel smoothing on a linear network.
- Support for one-dimensional smoothing kernels.
- Mark correlation function may include weights.
- Cross-correlation version of the mark correlation function.
- Penttinen pairwise interaction model.
- Improvements to simulation of Neyman-Scott processes.
• Improvements to fitting of Neyman-Scott models.
• Extended functionality for pixel images.
• Fitted intensity on linear network
• Triangulation of windows.
• Corrected an edge correction.

4 New datasets

The following new datasets have been added. These are now provided in the sub-package spatstat.data.

• **austates**: The states and large mainland territories of Australia represented as polygonal regions forming a tessellation.
• **redwood3**: a more accurate version of the redwood data.
• **cetaceans**: point patterns of whale and dolphin sightings.
• **concrete**: air bubbles in concrete.
• **btb**: bovine tuberculosis occurrences.

5 New classes

The following new classes of objects may be of use.

• **metric**: Class of distance metrics. An object of class metric represents a distance metric between points in two-dimensional space. See help(metric.object).
• **ssf**: Class of spatially sampled functions. An object of class "ssf" represents a spatial function which has been evaluated or sampled at an irregular set of points. See help(ssf).

6 New Functions

Following is a list of all the functions that have been added, starting with the most recent additions.

• **lurking.sirm**: Lurking variable plot for spatial logistic regression models.
• **eem.sirm**: Exponential energy marks for spatial logistic regression models.
• **eem.ppm**: Exponential energy marks for Gibbs and Poisson point process models (this function was previously called eem).
• **transformquantiles**: Transform the quantiles of a vector, matrix, array or pixel image.
• **convexmetric**: Distance metric based on a convex set.
  **invoke.metric**: Low level function to perform a desired operation using a given metric.
• **mean.ecdf, mean.ewcdf** Calculate the mean of an empirical cumulative distribution function.
• **rjitter.ppp** This function was previously called **rjitter**. It is now a method for the new generic function **rjitter**.

• **bufftess**: Distance buffer tessellation

• **ic**: Information criteria for model selection in ppm and kppm. Kindly contributed by Achmad Choiruddin, Jean-Francois Coeurjolly and Rasmus Waagepetersen.

• **rPSNCP**: Generate simulated realisations of the product shot noise Cox process. Contributed by Abdollah Jalilian, Yongtao Guan and Rasmus Waagepetersen.

• **spatcov**: Estimate the spatial covariance function of a pixel image.

• **summary.slrm, print.summary.slrm** Summary method for spatial logistic regression models

• **coef.summary.slrm**: Print the fitted coefficients, confidence interval and p-values for a spatial logistic regression model.

• **pairMean**: Compute the mean of a specified function of interpoint distance between random points in a window.

• **rjitterlpp**: Apply random displacements to the points on a linear network.

• **intersect.boxx**: Compute intersection of boxes in multi-dimensional space

• **scale.boxx, scale.ppx**: Methods for **scale** for boxes and patterns in multi-dimensional space

• **shift.boxx, shift.ppx**: Methods for **shift** for boxes and patterns in multi-dimensional space

• **is.boxx**: Determine whether an object is a multidimensional box

• **relrisk.lpp**: nonparametric estimation of relative risk on a network.

• **bw.relrisklpp**: Bandwidth selection for relative risk estimation on a network.

• **bw.1ppl**: Bandwidth selection for kernel density estimation of point patterns on a linear network, using likelihood cross-validation.

• **densityfun.lpp**: a method for **densityfun** for point patterns on a linear network.

• **addVertices**: Add new vertices to a network, at locations outside the existing network.

• **lengths.psp**: this is the new name of the function **lengths.psp**, which had to be changed because of a conflict with the generic **lengths**.

• **densityEqualSplit**: The equal-split algorithm for kernel density estimation on a network is now visible as a separate function.

• **densityHeat**: The heat-equation algorithm for kernel density estimation on a network is now visible as a separate function. It has also been extended to computing leave-one-out density estimates at the data points.

• **hotrod**: Compute the heat kernel \( \kappa(u, v) \) on a one-dimensional line segment.

• **heatkernelapprox**: Calculate an approximation to the value of the heat kernel on a network evaluated at the source point, \( \kappa(u, u) \).
- `is.linim`: test whether an object is a pixel image on a linear network (class "linim").
- `rcelllpp`: Simulate the cell point process on a linear network.
- `rSwitzerlpp`: Simulate the Switzer-type point process on a linear network.
- `intersect.lintess`: Form the intersection of two tessellations on a linear network.
- `chop.linnet`: Divide a linear network into tiles using infinite lines.
- `repairNetwork`: Detect and repair inconsistencies in internal data in a `linnet` or `lpp` object.
- `marks<-.lintess`, `unmark.lintess`: Assign marks to the tiles of a tessellation on a linear network.
- `marks.lintess`: Extract the marks of the tiles of a tessellation on a linear network.
- `tilenames.lintess`: Extract the names of the tiles in a tessellation on a linear network.
- `tilenames<-.lintess`: Change the names of the tiles in a tessellation on a linear network.
- `nobjects.lintess`: Count the number of tiles in a tessellation on a linear network.
- `as.data.frame.lintess`: Convert a tessellation on a linear network into a data frame.
- `repul`: Repulsiveness index for a determinantal point process model.
- `reach.kppm`: Reach (interaction distance) for a Cox or cluster point process model.
- `summary.dppm`, `print.summary.dppm`: Summary method for determinantal point process models.
- `nncross.ppx`: Nearest neighbours between two point patterns in any number of dimensions.
- `rthinclumps`: Divide a spatial region into clumps and randomly delete some of them.
- `densityQuick.lpp`: Fast kernel estimator of point process intensity on a network using 2D smoothing kernel.
- `data.lppm`: Extract the original point pattern dataset (on a linear network) to which the model was fitted.
- `bw.scott.iso`: Isotropic version of Scott’s rule (for point patterns in any dimension).
- `bits.envelope`: Global simulation envelope corresponding to `bits.test`, the balanced independent two-stage Monte Carlo test.
- `extrapolate.psp`: Extrapolate line segments to obtain infinite lines.
- `uniquemap`: Map duplicate points to unique representatives. Generic with methods for `ppp`, `lpp`, `ppx`.
- `uniquemap.data.frame`, `uniquemap.matrix`: Map duplicate rows to unique representatives.
- `localKcross`, `localLcross`, `localKdot`, `localLdot`, `localKcross.inhom`, `localLcross.inhom`: Multitype local \( K \) functions.
- `polartess`: tessellation using polar coordinates.
• \texttt{densityVoronoi}: adaptive estimate of point process intensity using tessellation methods.

• \texttt{densityAdaptiveKernel}: adaptive estimate of point process intensity using variable kernel methods.

• \texttt{bw.abram}: compute adaptive smoothing bandwidths using Abramson’s rule.

• \texttt{coords.quad}: method for \texttt{coords}, to extract the coordinates of the points in a quadrature scheme.

• \texttt{lineartileindex}: low-level function to classify points on a linear network according to which tile of a tessellation they fall inside.

• \texttt{markmarksscatter}: Mark–mark scatterplot.

• \texttt{bw.CvL}: Cronie-van Lieshout bandwidth selection for density estimation.

• \texttt{subset.psp}: subset method for line segment patterns.

• \texttt{densityfun}, \texttt{densityfun.ppp}: Compute a kernel estimate of intensity of a point pattern and return it as a function of spatial location.

• \texttt{as.im.densityfun}: Convert \texttt{function(x,y)} to a pixel image.

• \texttt{measureDiscrete}, \texttt{measureContinuous}: Extract the discrete and continuous components of a measure.

• \texttt{connected.tess}: Find connected components of each tile in a tessellation and make a new tessellation composed of these pieces.

• \texttt{dffit.ppm}: Effect change diagnostic DFFIT for spatial point process models.

• \texttt{shift.distfun}, \texttt{rotate.distfun}, \texttt{reflect.distfun}, \texttt{flipxy.distfun}, \texttt{affine.distfun}, \texttt{scalardilate.distfun}: Methods for geometrical operations on \texttt{distfun} objects.

• \texttt{rescale.distfun}: Change the unit of length in a \texttt{distfun} object.

• \texttt{plot.indicfun}: Plot method for indicator functions created by \texttt{as.function.owin}.

• \texttt{Smooth.leverage.ppm}, \texttt{Smooth.influence.ppm}: Smooth a leverage function or an influence measure.

• \texttt{integral.leverage.ppm}, \texttt{integral.influence.ppm}: Compute the integral of a leverage function or an influence measure.

• \texttt{mean.leverage.ppm}: Compute the mean value of a leverage function.

• \texttt{rectdistmap}: Distance map using rectangular metric.

• \texttt{rectcontact}: Contact distribution function using rectangular structuring element.

• \texttt{joinVertices}: Join specified vertices in a linear network.

• \texttt{summary ssf}: Summary method for a spatially sampled function (class \texttt{ssf}).

• \texttt{unstack.tess}: Given a tessellation with multiple columns of marks, take the columns one at a time, and return a list of tessellations, each carrying only one of the original columns of marks.
- **contour.leverage.ppm**: Method for `contour` for leverage functions of class `leverage.ppm`.

- **lurking**: New generic function for lurking variable plots.

- **lurking.ppp, lurking.ppm**: These are equivalent to the original function `lurking`. They are now methods for the new generic `lurking`.

- **lurking.mppm**: New method for class `mppm`. Lurking variable plot for models fitted to several point patterns.

- **print.lurk**: Prints information about the object returned by the function `lurking` representing a lurking variable plot.

- **model.matrix.mppm**: Method for `model.matrix` for models of class `mppm`.

- **test.crossing.psp, test.selfcrossing.psp**: Previously undocumented functions for testing whether segments cross.

- **to.saturated**: Convert a colour value to the corresponding fully-saturated colour.

- **intensity.psp**: Compute the average total length of segments per unit area.

- **boundingbox.psp**: Bounding box for line segment patterns. This produces a tighter bounding box than the previous default behaviour.

- **boundingbox.lpp**: Bounding box for point patterns on a linear network. This produces a tighter bounding box than the previous default behaviour.

- **boundingbox.linnet**: Bounding box for a linear network. This produces a tighter bounding box than the previous default behaviour.

- **"Frame<-.default"**: New default method for assigning bounding frame to a spatial object.

- **connected.pp3**: Connected components of a 3D point pattern.

- **colouroutputs, "colouroutputs<-"**: Extract or assign colour values in a colour map. (Documented a previously-existing function)

- **fitin.profilepl**: Extract the fitted interaction from a model fitted by profile likelihood.

- **[<-.linim**: Subset assignment method for pixel images on a linear network.

- **nnfromvertex**: Given a point pattern on a linear network, find the nearest data point from each vertex of the network.

- **tile.lengths**: Calculate the length of each tile in a tessellation on a network.

- **text.ppp, text.lpp, text.psp**: Methods for `text` for spatial patterns.

- **as.data.frame.envelope**: Extract function data from an envelope object, including the functions for the simulated data (‘simfuns’) if they were saved.

- **is.connected, is.connected.default, is.connected.linnet**: Determines whether a spatial object consists of one topologically connected piece, or several pieces.

- **is.connected.ppp**: Determines whether a point pattern is connected after all pairs of points closer than distance R are joined.
- **hist.funxy**: Histogram of values of a spatial function.
- **model.matrix.ippm**: Method for `model.matrix` which allows computation of regular and irregular score components.
- **harmonise.msr**: Convert several measures (objects of class `msr`) to a common quadrature scheme.
- **bits.test**: Balanced Independent Two-Stage Monte Carlo test, an improvement on the Dao-Genton test.
- **lineardirichlet**: Computes the Dirichlet-Voronoi tessellation associated with a point pattern on a linear network.
- **domain.lintess, domain.linfun**: Extract the linear network from a `lintess` or `linfun` object.
- **summary.lintess**: Summary of a tessellation on a linear network.
- **clicklpp**: Interactively add points on a linear network.
- **envelopeArray**: Generate an array of envelopes using a function that returns `fasp` objects.
- **bw.pcf**: Bandwidth selection for pair correlation function.
- **grow.box3**: Expand a three-dimensional box.
- **hexagon, regularpolygon**: Create regular polygons.
- **Ops.msr**: Arithmetic operations for measures.
- **Math.imlist, Ops.imlist, Summary.imlist, Complex.imlist**: Arithmetic operations for lists of pixel images.
- **measurePositive, measureNegative, measureVariation, totalVariation**: Positive and negative parts of a measure, and variation of a measure.
- **as.function.owin**: Convert a spatial window to a `function(x,y)`, the indicator function.
- **as.functionssf**: Convert an object of class `ssf` to a `function(x,y)`
- **as.function.leverage.ppm**: Convert an object of class `leverage.ppm` to a `function(x,y)`
- **sdr, dimhat**: Sufficient Dimension Reduction for point processes.
- **simulate.rhohat**: Simulate a Poisson point process with the intensity estimated by `rhohat`.
- **rlpp**: Random points on a linear network with a specified probability density.
- **cut.lpp**: Method for `cut` for point patterns on a linear network.
- **has.close**: Faster way to check whether a point has a close neighbour.
- **psib**: Sibling probability (index of clustering strength in a cluster process).
- **rags, ragsAreaInter, ragsMultiHard**: Alternating Gibbs Sampler for point processes.
- **bugfixes**: List all bug fixes in recent versions of a package.
• **ssf**: Create a spatially sampled function
• **print.ssf, plot.ssf, contour.ssf, image.ssf**: Display a spatially sampled function
• **as.im.ssf, as.ppp.ssf, marks.ssf, marks<-.ssf, unmark.ssf, [.ssf, with.ssf**: Manipulate data in a spatially sampled function
• **Smooth.ssf**: Smooth a spatially sampled function
• **integral.ssf**: Approximate integral of spatially sampled function
• **roc.kppm, roc.lppm, roc.lpp**: Methods for roc for fitted models of class "kppm" and "lpp" and point patterns of class "lpp"
• **auc.kppm, auc.lppm, auc.lpp**: Methods for auc for fitted models of class "kppm" and "lpp" and point patterns of class "lpp"
• **timeTaken**: Extract the timing data from a "timed" object or objects.
• **rotate.infline, shift.infline, reflect.infline, flipxy.infline**: Geometrical transformations for infinite straight lines.
• **whichhalfplane**: Determine which side of an infinite line a point lies on.
• **matrixpower, matrixsqrts, matrixinvsqrts**: Raise a matrix to any power.
• **points.lpp**: Method for points for point patterns on a linear network.
• **pairs.linim**: Pairs plot for images on a linear network.
• **closetriples**: Find close triples of points.
• **anyNA.im**: Method for anyNA for pixel images.
• **bc**: Bias correction (Newton-Raphson) for fitted model parameters.
• **rex**: Richardson extrapolation for numerical integrals and statistical model parameter estimates.
• **boundingcircle, boundingcentre**: Find the smallest circle enclosing a window or point pattern.
• **[.linim**: Subset operator for pixel images on a linear network.
• **mean.linim, median.linim, quantile.linim**: The mean, median, or quantiles of pixel values in a pixel image on a linear network.
• **weighted.median, weighted.quantile**: Median or quantile of numerical data with associated weights.
• **"[.linim"**: Subset operator for pixel images on a linear network.
• **mean.linim, median.linim, quantile.linim**: The mean, median, or quantiles of pixel values in a pixel image on a linear network.
• **boundingcircle, boundingcentre**: Smallest circle enclosing a spatial object.
• **split.msr**: Decompose a measure into parts.
• **unstack.msr**: Decompose a vector-valued measure into its component measures.
- `unstack.ppp, unstack.psp, unstack.lpp`: Given a spatial pattern with several columns of marks, separate the columns and return a list of spatial patterns, each having only one column of marks.

- `kernel.squint`: Integral of squared kernel, for the kernels used in density estimation.

- `as.im.data.frame`: Build a pixel image from a data frame of coordinates and pixel values.

- `covering`: Cover a window using discs of a given radius.

- `dilationAny, erosionAny, %(-)%`: Morphological dilation and erosion by any shape.

- `FmultiInhom, GmultiInhom`: Inhomogeneous multitypemarked versions of the summary functions `Fest, Gest`.

- `kernel.moment`: Moment or incomplete moment of smoothing kernel.

- `MinkowskiSum, %(+)%`: Minkowski sum of two windows: \( A \ %(+)% B \) or \( \text{MinkowskiSum}(A,B) \)

- `nobjects`: New generic function for counting the number of `things` in a dataset. There are methods for `ppp, ppx, psp, tess`.

- `parameters.interact, parameters.fii`: Extract parameters from interpoint interactions. (These existing functions are now documented.)

- `ppmInfluence`: Calculate `leverage.ppm, influence.ppm` and `dfbetas.ppm` efficiently.

- `rppm, plot.rppm, predict.rppm, prune.rppm`: Recursive-partition point process models.

- `simulate.mppm`: Simulate a point process model fitted to replicated point patterns.

- `update.interact`: Update the parameters of an interpoint interaction. [This existing function is now documented.]

- `where.max, where.min`: Find the spatial location(s) where a pixel image achieves its maximum or minimum value.

- `compileK, compilepcf`: make a \( K \) function or pair correlation function given the pairwise distances and their weights. [These existing internal functions are now documented.]

- `laslett`: Laslett’s Transform.

- `lintess`: Tessellation on a linear network.

- `divide.linnet`: Divide a linear network into pieces demarcated by a point pattern.

- `insertVertices`: Insert new vertices in a linear network.

- `thinNetwork`: Remove vertices and/or segments from a linear network etc.

- `connected.linnet`: Find connected components of a linear network.

- `nvertices, nvertices.linnet, nvertices.owin`: Count the number of vertices in a linear network or vertices of the boundary of a window.

- `as.data.frame.linim, as.data.frame.linfun`: Extract a data frame of spatial locations and function values from an object of class `linim` or `linfun`.
• as.linfun, as.linfun.linim, as.linfun.lintess: Convert other kinds of data to a linfun object.

• requireversion: Require a particular version of a package (for use in stand-alone R scripts).

• as.function.tess: Convert a tessellation to a function(x,y). The function value indicates which tile of the tessellation contains the point (x,y).

• tileindex: Determine which tile of a tessellation contains a given point (x, y).

• persp.leverage.ppm: Method for persp plots for objects of class leverage.ppm

• AIC.mppm, extractAIC.mppm: AIC for point process models fitted to replicated point patterns.

• nobs.mppm, terms.mppm, getCall.mppm: Methods for point process models fitted to replicated point patterns.

• rPenttinen: Simulate the Penttinen process using perfect simulation.

• varcount: Given a point process model, compute the predicted variance of the number of points falling in a window.

• inside.boxx: Test whether multidimensional points lie inside a specified multidimensional box.

• lixellate: Divide each segment of a linear network into smaller segments.

• nsegments.linnet, nsegments.lpp: Count the number of line segments in a linear network.

• grow.boxx: Expand a multidimensional box.

• deviance.ppm, deviance.lppm: Deviance for a fitted point process model.

• pseudoR2: Pseudo-R-squared for a fitted point process model.

• tiles.empty Checks whether each tile of a tessellation is empty or nonempty.

• summary.linim: Summary for a pixel image on a linear network.

• Determinantal Point Process models:
  – dppm: Fit a determinantal point process model.
  – fitted.dppm, predict.dppm, intensity.dppm: prediction for a fitted determinantal point process model.
  – Kmodel.dppm, pcfmodel.dppm: Second moments of a determinantal point process model.
  – rdpp, simulate.dppm: Simulation of a determinantal point process model.
  – logLik.dppm, AIC.dppm, extractAIC.dppm, nobs.dppm: Likelihood and AIC for a fitted determinantal point process model.
  – print.dppm, reach.dppm, valid.dppm: Basic information about a dpp model.
  – parameters.dppm: Extract meaningful list of model parameters.
  – objsurf.dppm: Objective function surface of a dppm object.
- `residuals.dppm`: Residual measure for a `dppm` object.

- Determinantal Point Process model families:
  - `dppBessel, dppCauchy, dppGauss, dppMatern, dppPowerExp`: Determinantal Point Process family functions.
  - `detpointprocfamilyfun`: Create a family function.
  - `update.detpointprocfamily`: Set parameter values in a determinantal point process model family.
  - `simulate.dppm`: Simulation.
  - `is.stationary.detpointprocfamily, intensity.detpointprocfamily, Kmodel.detpointprocfamily, pcfmodel.detpointprocfamily`: Moments.
  - `dim.detpointprocfamily, dppapproxkernel, dppapproxpcf, dppeigen, dppkernel, dppparbounds, dppeigenrange, dppspecden`: Helper functions.

- `dg.envelope`: Simulation envelopes corresponding to Dao-Genton test.

- `dg.progress`: Progress plot (envelope representation) for the Dao-Genton test.

- `dg.sigtrace`: Significance trace for the Dao-Genton test.

- `markcrosscorr`: Mark cross-correlation function for point patterns with several columns of marks.

- `rtemper`: Simulated annealing or simulated tempering.

- `rgb2hsva`: Convert RGB to HSV data, like `rgb2hsv`, but preserving transparency.

- `superimpose.ppplist, superimpose.splitppp`: New methods for 'superimpose' for lists of point patterns.

- `dkernel, pkernel, qkernel, rkernel`: Probability density, cumulative probability, quantiles and random generation from distributions used in basic one-dimensional kernel smoothing.

- `kernel.factor`: Auxiliary calculations for one-dimensional kernel smoothing.

- `spatdim`: Spatial dimension of any object in the `spatstat` package.

- `as.boxx`: Convert data to a multi-dimensional box.

- `intensity.ppx`: Method for `intensity` for multi-dimensional space-time point patterns.

- `fourierbasis`: Evaluate Fourier basis functions in any number of dimensions.

- `valid`: New generic function, with methods `valid.ppm, valid.lppm, valid.dppm`.

- `emend, emend.ppm, emend.lppm`: New generic function with methods for `ppm` and `lppm`. `emend.ppm` is equivalent to `project.ppm`.

- `Penttinen`: New pairwise interaction model.

- `quantile.density`: Calculates quantiles from kernel density estimates.

- `CDF.density`: Calculates cumulative distribution function from kernel density estimates.
• **triangulate.owin**: decompose a spatial window into triangles.
• **fitted.lppm**: fitted intensity values for a point process on a linear network.
• **parameters**: Extract all parameters from a fitted model.

7 Alphabetical list of changes

Here is a list of all changes made to existing functions, listed alphabetically.

• **adaptive.density**: This function can now perform adaptive estimation by two methods: either tessellation-based methods or variable-bandwidth kernel estimation. The calculations are performed by either `densityVoronoi` or `densityAdaptiveKernel`.

• **affine.owin**: Allows transformation matrix to be singular, if the window is polygonal.

• **alltypes**: If `envelope=TRUE` and the envelope computation reaches the maximum permitted number of errors (`maxnerr`) in evaluating the summary function for the simulated patterns, then instead of triggering a fatal error, the envelope limits will be set to `NA`.

• **anova.mppm**: 
  – Now handles Gibbs models, and performs the adjusted composite likelihood ratio test.
  – New argument `fine`.
  – Issues a warning when applied to random-effects models (models fitted using the argument `random`).

• **anyDuplicated.ppp**: Accelerated.

• **append.psp**: arguments may be `NULL`.

• **as.function.tess**: New argument `values` specifies the function values.

• **as.im.distfun**: New argument `approx` specifies the choice of algorithm.

• **as.im.function**: 
  – New argument `strict`.
  – New argument `stringsAsFactors`.
  – The formal default value of `stringsAsFactors` has been changed to `NULL` to conform to changes in R. (The actual default value is `TRUE` for R < 4.1.0 and `FALSE` for R >= 4.1.0).

• **as.im.leverage.ppm**: New argument `what`.

• **as.im.nnfun**: New argument `approx` chooses between a fast, approximate algorithm and a slow, exact algorithm.

• **as.im.smoothfun**: New argument `approx` chooses between a fast, approximate algorithm and a slow, exact algorithm.

• **as.layered**: Default method now handles a (vanilla) list of spatial objects.

• **as.linfun.lintess**: 

19
- New argument `values` specifies the function value for each tile.
- The default `values` are the marks, if present.
- New argument `nvalue`.
- Computation accelerated.

- `as.linim.default`: New arguments `delta` and `nd` control spacing of sample points in internal data.

- `as.linnet.linnet`: New argument `maxsize`.

- `as.linnet.psp`:
  - If the line segment pattern has marks, then the resulting linear network also carries these marks in the `$lines` component.
  - Computation accelerated.
  - The resulting network has attribute "camefrom" indicating the provenance of each line segment in the network.

- `as.lpp`: accepts more data formats:
  - Now handles the case where coordinates `seg` and `tp` are given but `x` and `y` are missing.
  - Now handles the case where `x` is a data frame with columns named `x,y,seg,tp` or `x,y` or `seg,tp`.

- `as.owin.default`:
  - Now refuses to convert a `box3` to a two-dimensional window.
  - Now accepts a structure with entries named `xmin,xmax, ymin, ymax` in any order. This handles objects of class `bbox` in the `sf` package.
  - Now detects objects of class `SpatialPolygons` and issues a more helpful error message.

- `as.owin.data.frame`: New argument `step`

- `as.polygonal`:
  - Can now repair errors in polygon data, if `repair=TRUE`.
  - Accelerated when `w` is a pixel mask.

- `as.psp`: now permits a data frame of marks to have only one column, instead of coercing it to a vector.

- `as.solist`: The argument `x` can now be a spatial object; `as.solist(cells)` is the same as `solist(cells)`.

- `bdist.points`: Accelerated for polygonal windows.

- `beachcolours`:
  - Improved positioning of the yellow colour band.
- If `sealevel` lies outside `srange`, then `srange` will be extended to include it (without a warning).

- **beachcolourmap**: Improved positioning of the yellow colour band.
- **bilinearform**: This function has been moved to the sub-package `spatstat.sparse`.
- **bind.fv**: New argument `clip`.
- **blur**: New argument `kernel`.
- **bw.abram**:
  - New argument `smoother` determines how the pilot estimate is computed.
  - Formal arguments rearranged.
- **bw.diggle, bw.ppl, bw.relrisk, bw.smoothppp**:
  - These functions now extract and store the name of the unit of length from the point pattern dataset. When the bandwidth selection criterion is plotted, the name of the unit of length is shown on the x-axis.
  - A warning is issued if the optimal value of the cross-validation criterion occurs at an endpoint of the search interval. New argument `warn`.
- **bw.ppl**:
  - New arguments `weights` and `sigma`.
  - New argument `shortcut` allows faster computation.
  - Additional arguments ... are now passed to `density.ppp`.
- **bw.scott**:
  - the two bandwidth values in the result now have names `sigma.x` and `sigma.y`.
  - Now handles point patterns of any dimension.
  - New arguments `isotropic` and `d`.
- **bw.stoyan**: The rule has been modified so that, if the pattern is empty, it is now treated as if it contained 1 point, so that a finite bandwidth value is returned.
- **cbind.hyperframe**:
  - The result now retains the `row.names` of the original arguments.
- **cdf.test**:
  - Calculations are more robust against numerical rounding effects.
  - The methods for classes `ppp, ppm, lpp, lppm, slrm` have a new argument `interpolate`.
  - Monte Carlo test runs much faster.
  - More jittering is applied when `jitter=TRUE`. Warnings about tied values should not occur any more.
• cdf.test.mppm:
  – Now handles Gibbs models.
  – Now recognises covariate="x" or "y".

• clarkevans: The argument correction="all" is now recognised: it selects all the available options. [This is also the default.]

• clickpoly: The polygon is now drawn progressively as the user clicks new vertices.

• closepairs.ppp: New argument periodic.

• closepairs.ppp, closepairs.pp3:
  – New arguments distinct and neat allow more options.
  – Argument ordered has been replaced by twice (but ordered is still accepted, with a warning).
  – Performance improved (computation time and memory requirements reduced.) This should improve the performance of many functions in spatstat.

• closepairs.pp3: Argument what can take the value "ijd"

• clusterset: Improved behaviour.

• clusterfit:
  – New argument algorithm specifies the choice of optimisation algorithm.
  – Changed precedence rule for handling the algorithm parameters in the minimum contrast algorithm. Individually-named arguments q,p,rmax,rmin now take precedence over entries with the same names in the list ctrl.
  – New argument verbose.

• colourmap: argument col have have length 1, representing a trivial colour map in which all data values are mapped to the same colour.

• collapse.fv:
  – This is now treated as a method for the nlme generic collapse. Its syntax has been adjusted slightly.
  – Recognises the abbreviations used by fvnames().

• connected.im: Now handles a logical-valued image properly. Arguments ... now determine pixel resolution.

• connected.owin: Arguments ... now determine pixel resolution.

• contour.im: New argument col specifies the colour of the contour lines. If col is a colour map, then the contours are drawn in different colours.

• convolve.im: the name of the unit of length is preserved.

• crossdist.lpp:
  – Now handles much larger networks, using the sparse representation of the network.
- New argument **check**.

- **crossing.psp**: New argument **details** gives more information about the intersections between the segments.

- **crosspairs.pp3**: Argument **what** can take the value "ijd"

- **cut.ppp**: Argument **z** can be "x" or "y" indicating one of the spatial coordinates.

- **dclf.test, mad.test, dclf.progress, mad.progress, dclf.sigtrace, mad.sigtrace, dg.progress, dg.sigtrace**:
  - New argument **clamp** determines the test statistic for one-sided tests.
  - New argument **rmin** determines the left endpoint of the test interval.
  - New argument **leaveout** specifies how to calculate discrepancy between observed and simulated function values.
  - New argument **scale** allows summary function values to be rescaled before the comparison is performed.
  - New argument **interpolate** supports interpolation of $p$-value.
  - Function values which are infinite, NaN or NA are now ignored in the calculation (with a warning) instead of causing an error. Warning messages are more detailed.

- **default.rmhcontrol, default.rmhexpand**: New argument **w**.

- **densityfun.ppp**: The resulting function can now handle query points which lie outside the window of the original data, and has argument **drop=TRUE** which specifies how to handle them.

- **densityEqualSplit**: New arguments **at** and **leaveoneout** for consistency with other functions.

- **densityHeat**:
  - default behaviour has changed slightly.
  - new argument **finespacing**.

- **density.lpp**:
  - New fast algorithm (up to 1000 times faster) for the default case where **kernel="gaussian"** and **continuous=TRUE**. Generously contributed by Greg McSwiggan.
  - Fast algorithm has been further accelerated.
  - Further accelerated when the point pattern contains duplicated points.
  - New argument **kernel** specifies the smoothing kernel. Any of the standard one-dimensional smoothing kernels can be used.
  - Now supports both the ‘equal-split continuous’ and ‘equal-split discontinuous’ smoothers. New argument **continuous** determines the choice of smoother.
  - New arguments **weights** and **old**.
  - New argument **distance** offers a choice of different kernel methods.
  - Infinite bandwidth (**sigma=Inf**) is now permitted, and results in a density estimate that is constant over all locations.

- **density.ppp**:
– A non-Gaussian kernel can now be specified using the argument \texttt{kernel}.
– Argument \texttt{weights} can now be a pixel image.
– Infinite bandwidth \texttt{sigma}=\texttt{Inf} is supported.
– Accelerated by about 30\% when \texttt{at="pixels"}.
– Accelerated by about 15\% in the case where \texttt{at="points"} and \texttt{kernel="gaussian"}.
– Accelerated in the cases where weights are given or \texttt{diggle=TRUE}.
– New argument \texttt{verbose}.

• \texttt{density.psp}:
  – New argument \texttt{method}.
  – Accelerated by 1 to 2 orders of magnitude.

• \texttt{density.splitppp}: New argument \texttt{weights}.

• \texttt{dfbetas.ppm}:
  – For Gibbs models, memory usage has been dramatically reduced, so the code can handle larger datasets and finer quadrature schemes.
  – Increased the default resolution of the pixel images. Spatial resolution can now be controlled by the arguments \texttt{dimyx, eps}.

• \texttt{diagnose.ppm}:
  – Infinite values of \texttt{rbord} are now ignored and treated as zero. This ensures that \texttt{diagnose.ppm} has a sensible default when the fitted model has infinite reach.
  – Accelerated, when \texttt{type="inverse"}, for models without a hard core.

• \texttt{diagnose.ppm, plot.diagppm}:
  – New arguments \texttt{col.neg, col.smooth} control the colour maps.
  – Accelerated, when \texttt{type="inverse"}, for models without a hard core.

• \texttt{dilation.ppp}: Improved geometrical accuracy. Now accepts arguments to control resolution of polygonal approximation.

• \texttt{dirichletEdges}: New argument \texttt{clip}.

• \texttt{discretise}: New argument \texttt{move.points} determines whether the point coordinates are also discretised.

• \texttt{discs}:
  – Now accepts a single numeric value for \texttt{radii}.
  – New argument \texttt{npoly}.
  – Accelerated in some cases.

• \texttt{distcdf}:
  – Arguments which are \texttt{NULL} will be treated as missing.
  – New argument \texttt{savedenom}.
• **distfun**: When the user calls a distance function that was created by `distfun`, the user may now give a `ppp` or `lpp` object for the argument `x`, instead of giving two coordinate vectors `x` and `y`.

• **distfun.lpp**:
  - New argument `k` allows computation of `k`-th nearest point.
  - Computation accelerated.

• **distmap.psp**: New arguments `extras` and `clip`.

• **dppm**: Changed precedence rule for handling the algorithm parameters in the minimum contrast algorithm. Individually-named arguments `q,p,rmax,rmin` now take precedence over entries with the same names in the list `ctrl`.

• **duplicated.ppp**: accelerated.

• **edge.Trans**: New argument `gW` for efficiency.

• **eem**: The function `eem` is now generic, with methods for `ppm` and `slrm`. The function previously named `eem` is now called `eem.ppm`.

• **effectfun**:
  - Now works for `ppm`, `kppm`, `lppm`, `dppm`, `rppm` and `profilepl` objects.
  - New argument `nvalues`.

• **envelope**:
  - New argument `clamp` gives greater control over one-sided envelopes.
  - New argument `funargs`
  - New argument `scale` allows global envelopes to have width proportional to a specified function of `r`, rather than constant width.
  - New argument `funYargs` contains arguments to the summary function when applied to the data pattern only.
  - The argument `simulate` can now be a function (such as `rlabel`). The function will be applied repeatedly to the original data pattern.
  - `rejectNA` and `silent`.

• **envelope.lpp**, **envelope.lppm**:
  - New arguments `fix.n` and `fix.marks` allow envelopes to be computed using simulations conditional on the observed number of points.
  - New arguments `maxnerr`, `rejectNA` and `silent`.

• **eval.im**: New argument `warn`.

• **eval.linim**: New argument `warn`.

• **ewcdf**:
  - Argument `weights` can now be `NULL`. 
- New arguments `normalise` and `adjust`.
- Computation accelerated.
- The result does not inherit class "ecdf" if `normalise=FALSE`.

- **Fest**: Additional checks for errors in input data.

- **Finhom**:
  - A warning is issued if bias is likely to occur because of undersmoothing.
  - New arguments `warn.bias` and `savelambda`.

- **fitted.lppm**: New argument `leaveoneout` allows leave-one-out computation of fitted value.

- **fitted.ppm**:
  - New option, `type="link"`.
  - New argument `ignore.hardcore`.

- **funxy**:
  - When the user calls a function that was created by `funxy`, the user may now give a `ppp` or `lpp` object for the argument `x`, instead of giving two coordinate vectors `x` and `y`.
  - Functions of class "funxy" can now be applied to quadrature schemes.

- **Gcross**: Function labels (shown on the plot legend) have been improved when `i = j`.

- **Geyer**: The saturation parameter `sat` can now be less than 1.

- **Ginhom**:
  - A warning is issued if bias is likely to occur because of undersmoothing.
  - New arguments `warn.bias` and `savelambda`.

- **grow.rectangle**: New argument `fraction`.

- **harmonise.im**: The result belongs to classes `solist` and `imlist` so that it can be plotted.

- **Hest**:
  - Argument `X` can now be a pixel image with logical values.
  - New argument `W`. [Based on code by Kassel Hingee.]
  - Additional checks for errors in input data.

- **hist.im**: New argument `xname`.

- **hyperframe**:
  - The formal default value of `stringsAsFactors` has been changed to NULL to conform to changes in R. (The actual default value is `TRUE` for R < 4.1.0 and `FALSE` for R >= 4.1.0).

- **identify.psp**: Improved placement of labels. Arguments can be passed to `text.default` to control the plotting of labels.

- **idw**: Standard errors can now be calculated by setting `se=TRUE`.  

```
• imcov: the name of the unit of length is preserved.

• im.apply:
  – Computation accelerated
  – New argument fun.handles.na
  – New argument check

• influence.ppm: For Gibbs models, memory usage has been dramatically reduced, so the code can handle larger datasets and finer quadrature schemes.

• integral.im: Accelerated in the case where domain is a tessellation.

• integral.linfun:
  – New argument delta controls step length of approximation to integral.
  – New argument nd controls approximate number of sample points used to calculate integral.
  – Argument domain can be a tessellation.
  – Now handles complex-valued functions.

• integral.linim:
  – Argument domain can be a tessellation.
  – Now handles complex-valued functions.

• integral.ssf: Argument domain can be a tessellation.

• intensity.ppm: Intensity approximation is now implemented for area-interaction model, and Geyer saturation model.

• interp.im: New argument bilinear.

• iplot, iplot.ppp, iplot.layered, iplot.linnet, iplot.default: These interactive plotting functions have been removed from spatstat into a new package spatstat.gui.

• ippm:
  – Accelerated.
  – The internal format of the result has been extended slightly.
  – Improved defaults for numerical algorithm parameters.

• istat: This interactive analysis function has been removed from spatstat into a new package spatstat.gui.

• Jcross: Function labels (shown on the plot legend) have been improved when i = j.

• Jfox: new argument warn.trim.

• Jinhom:
  – A warning is issued if bias is likely to occur because of undersmoothing.
  – New arguments warn.bias and savelambda.
• **Kcross**: Function labels (shown on the plot legend) have been improved when $i = j$.

• **Kcross.inhom, Kdot.inhom, Kmulti.inhom**:
  - These functions now allow intensity values to be given by a fitted point process model.
  - New arguments `update, leaveoneout, lambdaX`.
  - Leave-one-out calculation is now implemented when `lambdaX` is a fitted model of class "dppm".

• **Kest**
  - Accelerated computation (for translation and rigid corrections) when window is an irregular shape.
  - Calculation of isotropic edge correction for polygonal windows has changed slightly. Results are believed to be more accurate. Computation has been accelerated by about 20 percent in typical cases.

• **Kest.fft**: Now has arguments allowing control of spatial resolution.

• **Kinhom**:
  - New argument `ratio`.
  - Stops gracefully if `lambda` contains any zero values.
  - Leave-one-out calculation is implemented when `lambda` is a fitted model of class "dppm".

• **kppm**:
  - New default settings ensure greater numerical stability of the optimization algorithm against the effects of the scale of the spatial coordinates. New argument `stabilize` specifies whether the optimization algorithm should be numerically stabilized.
  - Fitting a model with `clusters="LGCP"` no longer requires the package `RandomFields` to be loaded explicitly.
  - New argument `algorithm` specifies the choice of optimisation algorithm.
  - Left hand side of formula can now involve entries in the list `data`.
  - Refuses to fit a log-Gaussian Cox model with anisotropic covariance.
  - A warning about infinite values of the summary function no longer occurs when the default settings are used. Also affects `mincontrast, cauchy.estpcf, lgcp.estpcf, matclust.estpcf, thomas.estpcf, vargamma.estpcf`.
  - Changed precedence rule for handling the algorithm parameters in the minimum contrast algorithm. Individually-named arguments `q, p, rmax, rmin` now take precedence over entries with the same names in the list `ctrl`.
  - Improved printed output.
  - Improved numerical robustness.

• **latest.news**: Now prints news documentation for the current major version, by default. New argument `major`.

• **Lcross.inhom, Ldot.inhom**: These functions now allow intensity values to be given by a fitted point process model. New arguments `update, leaveoneout, lambdaX`.
• lengths.psp:
  - New argument squared.
  - This function will soon be Deprecated in favour of the new name lengths.psp.

• Lest, Linhom, Ldot, Lcross, Ldot.inhom, Lcross.inhom: These summary functions now have explicit argument "correction".

• leverage.ppm:
  - For Gibbs models, memory usage has been dramatically reduced, so the code can handle larger datasets and finer quadrature schemes.
  - Increased the default resolution of the pixel images. Spatial resolution can now be controlled by the arguments dimyx, eps.

• leverage.ppm, influence.ppm, dfbetas.ppm:
  - These methods now work for models that were fitted by logistic composite likelihood (method='logi').
  - Computation has been vastly accelerated for models with Geyer interaction fitted using isotropic or translation edge corrections.
  - Faster computation in many cases.
  - Virtually all models and edge corrections are now supported, using a “brute force” algorithm. This can be slow in some cases.

• lineardisc:
  - New argument add.
  - Default plotting behaviour has changed.

• linearK, linearpcf and relatives:
  - substantially accelerated.
  - ratio calculations are now supported.
  - new argument ratio.

• linearKinhom: new argument normpower.

• linearKinhom, linearpcfinhom:
  - Changed behaviour when lambda is a fitted model.
  - New arguments update and leaveoneout.

• linearpcf: new argument normpower.

• linim:
  - The image Z is now automatically restricted to the network.
  - New argument restrict.

• linnet:
The internal format of a linnet (linear network) object has been changed. Existing datasets of class linnet are still supported. However, computation will be faster if they are converted to the new format. To convert a linnet object L to the new format, use L <- as.linnet(L).

If the argument edges is given, then this argument now determines the ordering of the sequence of line segments. For example, the i-th row of edges specifies the i-th line segment in as.psp(L).

New argument warn.

When argument edges is specified, the code now checks whether any edges are duplicated.

**lintess:**
- Argument df can be missing or NULL, resulting in a tessellation with only one tile.
- Tessellations can now have marks. New argument marks.

**localpcf:** New argument rvalue.

**localpcfinhom:**
- New arguments update, leaveoneout, rvalue.

**logLik.ppm:**
- New argument absolute.
- The warning about pseudolikelihood ('log likelihood not available') is given only once, and is not repeated in subsequent calls, within a spatstat session.

**logLik.mppm:** new argument warn.

**lohboot:**
- Algorithm has been corrected and extended thanks to Christophe Biscio and Rasmus Waagepetersen.
- New arguments block, basicboot, Vcorrection.
- Accelerated when the window is a rectangle.
- Now works for multitype K functions Kcross, Kdot, Lcross, Ldot, Kcross.inhom, Lcross.inhom
- Confidence bands for Lest, Linhom, Lcross, Ldot, Lcross.inhom are now computed differently. First a confidence band is computed for the corresponding K function Kest, Kinhom, Kcross, Kdot, Kcross.inhom respectively. Then this is transformed to a confidence band for the L function by applying the square root transformation.

**lpp:**
- The internal format of an lpp object has been changed. Existing datasets of class lpp are still supported. However, computation will be faster if they are converted to the new format. To convert an lpp object X to the new format, use X <- as.lpp(X).
- X can be missing or NULL, resulting in an empty point pattern.
- Now handles the case where coordinates seg and tp are given but x and y are missing.

**lppm:**
- New argument random controls placement of dummy points.
– Computation accelerated.

- **lurking.ppm**: accelerated.
- **lut**: argument **outputs** may have length 1, representing a lookup table in which all data values are mapped to the same output value.
- **markconnect**: Accepts the argument **weights** which is passed to **markcorr**.
- **markcorr**: New argument **weights** allows computation of the weighted version of the mark correlation function. Weights can be an expression to be evaluated, or a function, or a pixel image, or a numeric vector.
- **markvario**: Accepts the argument **weights** which is passed to **markcorr**.
- **mincontrast**: New argument **action.bad.values** specifies what action is taken when the summary function produces \( \texttt{NA} \) or \( \texttt{NaN} \) or infinite values.
- **minnndist, maxnndist**: New argument **by** makes it possible to find the minimum or maximum nearest neighbour distance between each pair of possible types in a multitype pattern.
- **mppm**:
  - Now handles models with a random effect component. (This is covered in [2, Chap. 16].)
  - New argument **random** is a formula specifying the random effect. (This is covered in [2, Chap. 16].)
  - Performs more checks for consistency of the input data.
  - New arguments **gcontrol** and **reltol.pql** control the fitting algorithm.
  - New argument **weights** specifies case weights for each row of data.
- **msr**: Infinite and \( \texttt{NA} \) values are now detected (if **check=TRUE**) and are reset to zero, with a warning.
- **nbfires**:
  - the unit of length for the coordinates is now specified in this dataset.
  - This dataset now includes information about the different land and sea borders of New Brunswick.
- **nnccorr, nnmean, nnvario**: New argument **na.action**.
- **nncross.lpp**:
  - New argument **k** allows computation of \( k \)-th nearest point.
  - Computation accelerated.
- **nndist.pp3**: New argument **by** allows computation of the nearest distance to each group of points.
- **nndist.ppx**: New argument **by** allows computation of the nearest distance to each group of points.
- **nndist.lpp**
New argument \( k \) allows computation of \( k \)-th nearest point.
- new argument \( k \) by allows computation of the nearest distance to each group of points.
- Computation accelerated.

- **nndist.lpp:**
  - New argument \( k \) allows computation of \( k \)-th nearest point.
  - new argument \( k \) by allows computation of the nearest distance to each group of points.
  - Computation accelerated.

- **nnfun.lpp:**
  - New argument \( k \).
  - New argument \( value \) specifies whether to return the index of the nearest neighbour or the mark value of the nearest neighbour.

- **nnfun.ppp:**
  - New argument \( value \) specifies whether to return the index of the nearest neighbour or the mark value of the nearest neighbour.

- **nnfun.psp:**
  - New argument \( value \) specifies whether to return the index of the nearest neighbour or the mark value of the nearest neighbour.

- **ewin:** If argument \( mask \) is a logical matrix, \( NA \) entries will be accepted, and converted to \( \text{FALSE} \).

- **padimage:** New argument \( W \) allows an image to be padded out to fill any window.

- **pairdist.lpp:** Now handles much larger networks, using the sparse representation of the network.

- **pairorient:** Default edge corrections now include "bord.modif".

- **pairs.im:** new argument \( drop \).

- **parres:** the argument \( covariate \) is allowed to be missing if the model only depends on one covariate.

- **pcf.ppp:**
  - New argument \( close \) for advanced use.
  - New argument \( ratio \) allows several estimates of pcf to be pooled.
  - Now calculates an analytic approximation to the variance of the estimate of the pair correlation function (when \( \text{var.approx} = \text{TRUE} \)).
  - Now returns the smoothing bandwidth used, as an attribute of the result.
  - New argument \( close \) for advanced use.
  - Now accepts \( \text{correction}" = "\text{none}" \).

- **pcfinhom:**
New argument `close` for advanced use.
Default behaviour is changed when `lambda` is a fitted model. The default is now to re-fit the model to the data before computing `pcf`. New arguments `update` and `leaveoneout` control this.

New argument `close` for advanced use.

Now handles `correction="good"`
Leave-one-out calculation is implemented when `lambda` is a fitted model of class "dppm".

- `persp.funxy`: Improved z-axis label.

- `pixellate.ppp`:
  - If the pattern is empty, the result is an integer-valued image (by default) for consistency with the results for non-empty patterns.
  - Accelerated in the case where weights are given.
  - New arguments `fractional` and `preserve` for more accurate discretisation.
  - New argument `savemap`.

- `plot.anylist`:
  - If a list entry `x[[i]]` belongs to class "anylist", it will be expanded so that each entry `x[[i]][[j]]` will be plotted as a separate panel.
  - New arguments `panel.begin.args`, `panel.end.args`
  - Result is now an (invisible) list containing the result from executing the plot of each panel.

- `plot.colourmap`:
  - Now handles a colour map for a zero-length interval `[a,a]`
  - New argument `increasing` specifies whether the colours are displayed in order left-to-right/bottom-to-top.
  - Changed default behaviour for discrete colour maps when `vertical=FALSE`.

- `plot.im`:
  - Now handles complex-valued images.
  - New argument `workaround` to avoid a bug in some MacOS device drivers that causes the image to be displayed in the wrong spatial orientation.
  - The number of tick marks in the colour ribbon can now be controlled using the argument `nint` in `ribargs`.
  - Improved behaviour when all pixel values are `NA`.
  - Improved handling of tickmarks on colour ribbon.
  - Improved behaviour when the image values are almost constant.
  - New argument `riblab`.
  - Axes are prevented from extending outside the image rectangle.
  - New argument `zap`.
  - Some warnings are suppressed when `do.plot=FALSE`. 
• **plot.imlist**: Result is now an (invisible) list containing the result from executing the plot of each panel.

• **plot.influence.ppm**: New argument `multiplot`.

• **plot.kppm**:
  - New arguments `pause` and `xname`.
  - The argument `what="all"` is now recognised: it selects all the available options. [This is also the default.]

• **plot.leverage.ppm**:
  - New arguments `multiplot` and `what`.
  - A contour line showing the average value of leverage is now drawn on the colour ribbon, as well as on the main image. New argument `args.contour`.

• **plot.linfun**:
  - Now passes arguments to the function being plotted.
  - A scale bar is now plotted when `style="width"`.
  - New argument `legend`.
  - The return value has a different format.

• **plot.linim**:
  - The return value has a different format.
  - New argument `fatten` improves visual appearance when `style="colour"`.
  - A scale bar is now plotted when `style="width"`.
  - When `style="width"`, negative values are plotted in red (by default). New argument `negative.args` controls this.
  - New argument `zlim` specifies the range of values to be mapped.
  - New explicit argument `box` determines whether to plot a bounding box; default is `FALSE` in all cases.

• **plot.lintess**:
  - Improved plot method, with more options.
  - Modified to display the marks attached to the tiles.
  - Options: `style=c("colour", "width", "image")`.

• **plot.lpp**:
  - New argument `show.network`.
  - For a point pattern with continuous marks (“real numbers”) the colour arguments `cols, fg, bg` can now be vectors of colour values, and will be used to determine the default colour map for the marks.

• **plot.mppm**: New argument `se`. 
- `plot.msr`:
  - Now handles multitype measures.
  - New argument `multiplot`.
  - New argument `massthresh`.
  - New arguments `equal.markscale` and `equal.ribbon`.

- `plot.onearrow`:
  Graphical parameters, specified when the object was created, are now taken as the defaults for graphical parameters to the plot.

- `plot.owin`:
  New argument `use.polypath` controls how to plot a filled polygon when it has holes.

- `plot.profilepl`:
  This function has now been documented, and the graphics improved.

- `plot.psp`:
  - Segments can be plotted with widths proportional to their mark values.
  - New argument `style`.
  - New argument `col` gives control over the colour map representing the values of marks attached to the segments.
  - The code for `style="width"` has been completely rewritten, so that it no longer depends on `plot.linim`, and is much more efficient.
  - The formal argument list has been extended.

- `plot.pp3`:
  New arguments `box.front`, `box.back` control plotting of the box.

- `plot.ppp`:
  - The default colour for the points is now a transparent grey, if this is supported by the plot device.
  - For a point pattern with continuous marks (“real numbers”) the colour arguments `cols`, `fg`, `bg` can now be vectors of colour values, and will be used to determine the default colour map for the marks.
  - Now recognises graphics parameters for text, such as `family` and `srt`.
  - When `clipwin` is given, any parts of the boundary of the window of `x` that lie inside `clipwin` will also be plotted.
  - Improved placement of symbol map legend when argument `symap` is given.

- `plot.tess`:
  - This plot method can now fill each tile with a different colour.
  - New arguments `do.col`, `values`, `col` and `ribargs`. Old argument `col` has been renamed `border` for consistency.
  - Now generates a separate plot panel for each column of marks, if `do.col=TRUE`.
  - New argument `multiplot`.

- `plot.profilepl`, `plot.quadratcount`, `plot.quadrattest`, `plot.tess`:
  Now recognise graphics parameters for text, such as `family` and `srt`.
• plot.solist:
  - New arguments panel.begin.args, panel.end.args
  - Result is now an (invisible) list containing the result from executing the plot of each panel.

• plot.studpermtest: This existing function now has a help file.

• plot.symbolmap: New argument nsymbols controls the number of symbols plotted.

• ponderosa: In this installed dataset, the function ponderosa.extra$plotit has changed slightly (to accommodate the dependence on the package spatstat.utils).

• polynom: This function now has a help file.

• pool.fv:
  - The default plot of the pooled function no longer includes the variance curves.
  - New arguments relabel and variance.

• pool.rat: New arguments weights, relabel and variance.

• ppm:
  - Argument interaction can now be a function that makes an interaction, such as Poisson, Hardcore, MultiHard.
  - Argument subset can now be a window (class "owin") specifying the sub-region of data to which the model should be fitted.

• ppm.ppp, ppm.quad:
  - New argument emend, equivalent to project.
  - New arguments subset and clipwin.

• ppmInfluence: The result now belongs to class ppmInfluence, for which there are methods for leverage, influence, dfbetas which extract the desired component.

• ppp:
  - New argument checkdup.
  - If the coordinate vectors x and y contain NA, NaN or infinite values, these points are deleted with a warning, instead of causing a fatal error.

• pp3: New argument marks.

• predict.kppm, residuals.kppm Now issues a warning when the calculation ignores the cluster/Cox component and treats the model as if it were Poisson. (This currently happens in predict.kppm when se=TRUE or interval != "none", and in residuals.kppm when type != "raw").

• predict.lppm: Argument locations can now be an lpp object.

• predict.mppm:
  - The argument type="all" is now recognised: it selects all the available options. [This is also the default.]
– Now supports multitype point process models.
– Improved handling of argument `newdata`.

• `predict.ppm`:
  – Now recognises the arguments `dimyx` and `eps` for specifying the resolution of the grid of prediction points.
  – New argument `ignore.hardcore`.
  – Accelerated for models fitted with `method="VBlogi"`

• `predict.rhohat`: New argument `what` determines which value should be calculated: the function estimate, the upper/lower confidence limits, or the standard error.

• `print.linim`: More information is printed.
• `print.lintess`: Output includes information about marks.
• `print.quad`: More information is printed.
• `print.rmhmodel`: More information is printed.

• `progressreport`
  – Behaviour improved.
  – New arguments `state`, `tick`, `showtime`.
  – New option: `style="tk"

• `pseudoR2.ppm`, `pseudoR2.lppm`:
  – The null model now includes any offset terms, by default.
  – New argument `keepoffset`.

• `quadform`: This function has been moved to the sub-package `spatstat.sparse`.

• `quadratcount.ppp`: Computation accelerated in some cases.

• `quadrat.test.ppm`: Computation accelerated in some cases.

• `quantess`
  – The covariate Z can now be "rad" or "ang" representing polar coordinates.
  – New argument `origin` specifies the origin of polar coordinates.
  – New argument `eps` controls the accuracy of the calculation.

• `quantile.ewcdf`: The function is now normalised to the range \([0,1]\) before the quantiles are computed. This can be suppressed by setting `normalise=FALSE`.

• `qqplot.ppm` Argument `expr` can now be a list of point patterns, or an envelope object containing a list of point patterns.

• `rbind.hyperframe`: The result now retains the `row.names` of the original arguments.

• `rcellnumber`: New argument `mu`. 37
• **rebound.owin**: Now preserves unitnames of the objects.

• **rescale.owin, rescale.ppp, rescale.psp**: The geometrical type of the window is now preserved in all cases. (Previously if the window was polygonal but was equivalent to a rectangle, the rescaled window was a rectangle.)

• **rgbim, hsvim**: New argument `A` controls the alpha (transparency) channel.

• **rgb2hex, col2hex, paletteindex, is.colour, samecolour, complementarycolour, is.grey, to.grey**: These colour tools now handle transparent colours.

• **rgb2hex**: New argument `maxColorValue`

• **relrisk.ppp**:
  - If `se=TRUE` and `at="pixels"`, the result belongs to class `solist`.
  - The arguments `adjust, edge, diggle` are now explicit formal arguments.
  - New argument `weights`.

• **rhohat**:
  - The result now includes the “average” intensity $\bar{\rho}$.
  - New options `smoother="piecewise"` computes a piecewise-constant estimate of $\rho(z)$.
  - Nonparametric maximum likelihood estimation is now supported, assuming the intensity is a monotone function of the covariate.
  - New options `smoother="increasing"` and `smoother="decreasing"`.
  - New argument `subset` allows computation for a subset of the data.
  - New argument `positiveCI` specifies whether confidence limits should always be positive.

• **rhohat.lpp**: New argument `random` controls placement of dummy points.

• **rlabel**:
  - New argument `group` specifies that the points are divided into several groups, and that relabelling is applied within each group.
  - New arguments `nsim` and `drop`.
  - `X` can now be a point pattern of any type (`ppp, lpp, pp3, ppx`) or a line segment pattern (`psp`).

• **rlabel.ppp**: New argument `group` specifies that the points are divided into several groups, and that relabelling is applied within each group.

• **rLGCP**:
  - Accelerated.
  - This function no longer requires the package `RandomFields` to be loaded explicitly.

• **rMaternI, rMaternII**: These functions can now generate random patterns in three dimensions and higher dimensions, when the argument `win` is of class `box3` or `boxx`.

• **rmh**
Accelerated, in the case where multiple patterns are saved using nsave.
- The printed output of the debugger (invoked by snoop=TRUE) has been improved.

- \texttt{rmh.ppm}, \texttt{rmhmodel.ppm}, \texttt{simulate.ppm}: A model fitted using the Penttinen interaction can now be simulated.

- \texttt{rmh.default}, \texttt{rmhmodel.default}:
  - These functions now recognise \texttt{cif='penttinen'} for the Penttinen interaction.
  - New arguments \texttt{nsim, saveinfo}.
  - The printed output of the debugger (invoked by snoop=TRUE) has been improved.

- \texttt{rmhcontrol}:
  - New parameter \texttt{pstage} determines when to generate random proposal points.
  - The parameter \texttt{nsave} can now be a vector of integers.

- \texttt{rose.default} New argument \texttt{weights}.

- \texttt{rose} New arguments \texttt{start} and \texttt{clockwise} specify the convention for measuring and plotting angles.

- \texttt{rotmean}:
  - New argument \texttt{padzero}.
  - Default behaviour has changed.
  - Improved algorithm stability.
  - The result now has the same \texttt{unitname} as the input object.
  - New argument \texttt{adjust} controls the smoothing bandwidth.

- \texttt{rpoint}: New argument \texttt{forcewin} forces the code to use the window \texttt{win} when \texttt{f} is a pixel image.

- \texttt{rpoispp}: Accelerated, when \texttt{lambda} is a pixel image.

- \texttt{rpoisppx} New argument \texttt{drop}.

- \texttt{rpoisline}: Also returns information about the original infinite random lines.

- \texttt{rpoislpp}: If \texttt{lambda} is a list of "\texttt{linim}" or "\texttt{linfun}" objects, then the argument \texttt{L} can be omitted.

- \texttt{rshift.ppp, rshift.splitppp}: new argument \texttt{nsim}.

- \texttt{rSSI}: Accelerated.

- \texttt{rStrauss, rHardcore, rStraussHard, rDiggleGratton, rDGS, rPenttinen}: New argument \texttt{drop}.

- \texttt{rtemper}: new argument \texttt{track}.

- \texttt{rthin}
  - Accelerated, when \texttt{P} is a single number.
X can now be a point pattern of any type (ppp, lpp, pp3, ppx) or a line segment pattern (psp).

- \texttt{rThomas}, \texttt{rMatClust}, \texttt{rCauchy}, \texttt{rVarGamma}:
  - When the model is approximately Poisson, it is simulated using \texttt{rpoispp}. This avoids computations which would require huge amounts of memory. New argument \texttt{poisthresh} controls this behaviour.
  - New argument \texttt{saveparents}.

- \texttt{runifpointOnLines}, \texttt{rpoisppOnLines}: New argument \texttt{drop}.

- \texttt{runifpointx}: New argument \texttt{drop}.

- \texttt{selfcut.psp}:
  - Computation accelerated.
  - The result now has an attribute "\texttt{camefrom}" indicating the provenance of each segment in the result.
  - No longer checks for validity of the resulting segments.

- \texttt{sessionInfo}: Output now includes a list of packages that are imported but not loaded.

- \texttt{sessionLibs}: Package names are now sorted alphabetically

- \texttt{setcov}:
  - the name of the unit of length is preserved.

- \texttt{shapley}:
  - In this installed dataset, the function \texttt{shapley.extra$plotit} has changed slightly (to accommodate the dependence on the package \texttt{spatstat.utils}).

- \texttt{shift.im}, \texttt{shift.owin}, \texttt{shift.ppp}, \texttt{shift.psp}:
  - More options for the argument \texttt{origin}.

- Simulation: Several basic simulation algorithms have been accelerated. Consequently, simulation outcomes are not identical to those obtained with previous versions of \texttt{spatstat}, even when the same random seed is used. To ensure compatibility with previous versions of spatstat, revert to the slower code by setting \texttt{spatstat.options(fastthin=FALSE, fastpois=FALSE)}.

- \texttt{simulate.kppm}:
  - Conditional simulation of the model, given a fixed number of points, is now supported using the new arguments \texttt{n.cond} and \texttt{w.cond}.
  - Accelerated for LGCP models.
  - Additional arguments \ldots{} are now passed to the function that performs the simulation.

- \texttt{simulate.ppm}:
  - New argument \texttt{w} controls the window of the simulated patterns.
  - New argument \texttt{verbose}.
  - Now recognises the argument \texttt{window} as an alternative to \texttt{w}.

- \texttt{slrm}:  

40
- In the default case (where `dataAtPoints` is not given) all spatial covariates, including the spatial coordinates `x` and `y`, are now evaluated at the centre of each pixel. This improves consistency with other implementations of spatial logistic regression.
- Silently ignores any arguments '...' that are not recognised by `as.mask`.

**Smooth.ppp:**
- A non-Gaussian kernel can now be specified using the argument `kernel`.
- Argument `weights` can now be a pixel image, a function, a numeric vector or an expression to be evaluated.
- Infinite bandwidth `sigma=Inf` is supported.
- Accelerated by about 30% in the case where `at="pixels"`.
- Accelerated by about 15% in the case where `at="points"` and `kernel="gaussian"`.
- Now exits gracefully if any mark values are `NA`, `NaN` or `Inf`.
- New argument `geometric` supports geometric-mean smoothing.
- The arguments `adjust`, `edge`, `diggle` and `kernel` are now explicit formal arguments.

**solist:** New argument `.NameBase`.

**spatialcdf:**
- Computation accelerated.
- The result does not inherit class `"ecdf"` if `normalise=FALSE`.

**spatstat.options** New options `fastthin` and `fastpois` enable fast simulation algorithms. Set these options to `FALSE` to reproduce results obtained with previous versions of `spatstat`.

**split.ppp, split.ppx:** The splitting variable `f` can now be a logical vector.

**split<-.ppp:** The default for argument `un` in `split<-.ppp` now agrees with the default for the same argument in `split.ppp`.

**square:** Handles a common error in the format of the arguments.

**step:** now works for models of class `"mppm"`.

**stieltjes:** Argument `M` can be a stepfun object (such as an empirical CDF).

**subset.ppp, subset.lpp, subset.pp3, subset.ppx:** The argument `subset` can now be any argument acceptable to the `[" method.

**Summary.linim** (methods for the operations `range`, `max`, `min` etc): Recognises the argument `finite` so that `range(x, finite=TRUE)` works for a linim object `x`.

**summary functions:** The argument `correction="all"` is now recognised: it selects all the available options.

This applies to `Fest`, `F3est`, `Gest`, `Gcross`, `Gdot`, `Gmulti`, `G3est`, `Gfox`, `Gcom`, `Gres`, `Hest`, `Jest`, `Jmulti`, `Jcross`, `Jdot`, `Jfox`, `Kest`, `Kinhom`, `Kmulti`, `Kcross`, `Kdot`, `Kcom`, `Kres`, `Kmulti.inhom`, `Kcross.inhom`, `Kdot.inhom`, `Kscaled`, `Ksector`, `Kmark`, `K3est`, `Lscaled`, `markcorr`, `markcrosscorr`, `nnorient`, `pairorient`, `pcfinhom`, `pcfcross.inhom`, `pcf`, `Tstat`. 41
• **summary.distfun, summary.funxy:**
  - More information is printed.
  - Pixel resolution can now be controlled.

• **summary.im:** Output improved when the image is empty (i.e. when all pixel values are undefined).

• **summary.kppm:** prints more information about algorithm convergence.

• **summary.lintess:** prints information about marks.

• **summary.mppm:** Improved summary of the dependence of the interpoint interaction on the covariates.

• **summary.ppm:** New argument `fine` selects the algorithm for variance estimation.

• **summary.owin, summary.im:** The fraction of frame area that is occupied by the window/image is now reported.

• **sumouter:**
  - New argument `y` allows computation of asymmetric outer products.
  - This function has now been moved to the sub-package *spatstat.sparse*

• **symbolmap:**
  - Now accepts a vector of colour values for the arguments `col, cols, fg, bg` if the argument `range` is given.
  - New option: `shape="arrows"`.

• **tess:** Argument `window` is ignored when `xgrid, ygrid` are given.

• **texturemap:** Argument `textures` can be missing or NULL.

• **textureplot:** Argument `x` can now be something acceptable to `as.im`.

• **tilenames, tilenames<-:** These functions are now generic, with methods for `tess` and `lintess`.

• **to.grey** New argument `transparent`.

• **transect.im:** new argument `nsample`.

• **union.owin:** Improved behaviour when there are more than 2 windows.

• **unstack.lintess:** now handles marks.

• **update:** now works for models of class "mppm".

• **update.kppm:**
  - New argument `evaluate`.
  - Now handles additional arguments in any order, with or without names.
  - Changed arguments.
  - Improved behaviour.
• **update.ppm**: For the case `update(model, X)` where `X` is a point pattern, if the window of `X` is different from the original window, then the model is re-fitted from scratch (i.e. `use.internal=FALSE`).

• **valid.ppm** This is now a method for the generic function `valid`.

• **vcov.mppm**:
  - Now handles models with Gibbs interactions.
  - New argument `ncoeff.action` specifies what to do if some of the fitted coefficients are `NA`, `NaN` or `Inf`.

• **vcov.ppm**:
  - Performance slightly improved, for Gibbs models.
  - Variance calculations now handle larger datasets because they use sparse arrays, by default.
  - New argument `ncoeff.action` specifies what to do if some of the fitted model coefficients are `NA`, `NaN` or infinite.

• **[<-.im**
  - Accepts an array for `value`.
  - The subset index `i` can now be a linear network. Then the result of `x[i, drop=FALSE]` is a pixel image of class `linim`.
  - New argument `drop` controls behaviour when indices are missing as in `x[] <- value`

• **[.layered**
  - Subset index `i` can now be an `owin` object.
  - Additional arguments `...` are now passed to other methods.

• **[.leverage.ppm**: New argument `update`.

• **[.linnet**
  - New argument `snip` determines what to do with segments of the network that cross the boundary of the window. Default behaviour has changed.
  - More robust against artefacts when the subset index is a pixel mask.

• **[.linim**
  - More robust against artefacts.
  - Accelerated.

• **[.lpp**: New argument `snip` determines what to do with segments of the network that cross the boundary of the window. Default behaviour has changed.

• **[.ppx**
  - The subset index `i` may now be a spatial domain of class `boxx` or `box3`.
  - New argument `clip`.

• **[.ppp** New argument `clip` determines whether the window is clipped.
• [.ppp] The previously-unused argument drop now determines whether to remove unused levels of a factor.

• [.pp3, .lpp, .ppx, subset.ppp, subset.pp3, subset.lpp, subset.ppx]: These methods now have an argument drop which determines whether to remove unused levels of a factor.

• [.psp]:
  – accelerated.
  – New argument fragments specifies whether to keep fragments of line segments that are cut by the new window, or only to retain segments that lie entirely inside the window.

• [.solist]: Subset index i can now be an owin object.
