

# Package ‘striprtf’

May 9, 2026

**Type** Package

**Title** Extract Text from RTF File

**Version** 0.6.0

**Description** Extracts plain text from RTF (Rich Text Format) file.

**License** MIT + file LICENSE

**Depends** R (>= 3.0)

**Imports** magrittr, Rcpp, stringr, utils

**Suggests** testthat

**RoxygenNote** 7.2.3

**LinkingTo** Rcpp

**URL** <https://github.com/kota7/striprtf>

**BugReports** <https://github.com/kota7/striprtf/issues>

**Encoding** UTF-8

**NeedsCompilation** yes

**Author** Kota Mori [aut, cre]

**Maintainer** Kota Mori <kmori05@gmail.com>

**Repository** CRAN

**Date/Publication** 2023-08-10 16:20:02 UTC

<b>Index</b>	<b>6</b>
--------------	----------

---

looks_rtf	<i>Test if a file looks like an RTF</i>
-----------	---

---

**Description**

Validate if a file looks like an RTF. The test should be seen as a minimal requirement; If failed, the file is highly likely that the file is invalid, while passed, there is still possibility that the file does not follow the rule of RTF files.

**Usage**

```
looks_rtf(con, n = 1000)
```

**Arguments**

con	A connection object or string of file name
n	Integer that specifies the length of contents to be tested. If smaller than 10, forced to 10.

**Value**

Logical.

---

read_rtf	<i>Extract Text from RTF (Rich Text Format) File</i>
----------	--

---

**Description**

Parses an RTF file and extracts plain text as character vector.

**Usage**

```
read_rtf(  
  file,  
  verbose = FALSE,  
  row_start = "*| ",  
  row_end = "",  
  cell_end = " | ",  
  ignore_tables = FALSE,  
  check_file = TRUE,  
  ...  
)  
  
strip_rtf(  
  text,
```

```

    verbose = FALSE,
    row_start = "*| ",
    row_end = "",
    cell_end = " | ",
    ignore_tables = FALSE
  )

```

### Arguments

<code>file</code>	Path to an RTF file. Must be character of length 1.
<code>verbose</code>	Logical. If TRUE, progress report is printed on console. While it can be informative when parsing a large file, this option itself makes the process slow.
<code>row_start, row_end</code>	strings to be added at the beginning and end of table rows
<code>cell_end</code>	string to be put at the end of table cells
<code>ignore_tables</code>	if TRUE, no special treatment for tables
<code>check_file</code>	if TRUE, conducts a quick check on the file if it is an RTF file. If the file fails to pass the check, returns NULL without parsing the file.
<code>...</code>	Additional arguments passed to <a href="#">readLines</a>
<code>text</code>	Character of length 1. Expected to be contents of an RTF file.

### Details

Rich text format (RTF) files are written as a text file consisting of ASCII characters. The specification has been developed by Microsoft. This function interprets the character strings and extracts plain texts of the file. Major part of the algorithm of this function comes from a stack overflow thread (<https://stackoverflow.com/a/188877>) and the references therein. This function is a translation of the above to R language, associated with C++ codes for enhancement.

An advance from the preceding implementation is that the function accomodates with various ANSI code pages. For example, RTF files created by Japanese version of Microsoft Word marks `\ansicpg932`, which indicates the code page 932 is used for letter-code conversion. The function detects the code page indication and convert the characters to UTF-8 where possible. Conversion tables are retrieved from here: (<https://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/>).

### Value

Character vector of extracted text

### References

- Original discussion thread: <https://stackoverflow.com/a/188877>
- Code page table: <https://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/>

### Examples

```
read_rtf(system.file("extdata/king.rtf", package = "striprtf"))
```

---

striprtf-deprecated     *Renamed Functions*

---

### Description

From ver 0.3.1, the functions are renamed as follows:

- striprtf → [read\\_rtf](#)
- rtf2text → [strip\\_rtf](#)

### Usage

```
striprtf(file, verbose = FALSE, ...)
```

```
rtf2text(text, verbose = FALSE)
```

### Arguments

file	Path to an RTF file. Must be character of length 1.
verbose	Logical. If TRUE, progress report is printed on console. While it can be informative when parsing a large file, this option itself makes the process slow.
...	Additional arguments passed to <a href="#">readLines</a>
text	Character of length 1. Expected to be contents of an RTF file.

### Value

Character vector of extracted text

---

unused\_letters     *Find letters not used in strings*

---

### Description

Returns letters not used in strings

### Usage

```
unused_letters(
  s,
  n = 1,
  avoid_striprtf_internal = TRUE,
  as_number = FALSE,
  as_vector = FALSE
)
```

**Arguments**

<code>s</code>	character vector
<code>n</code>	number of letters to return
<code>avoid_strifrtf_internal</code>	If TRUE, letters used in the package's internal process are also regarded as "used".
<code>as_number</code>	if TRUE, return unicode numbers instead of letters itself
<code>as_vector</code>	if FALSE (and <code>as_number</code> is FALSE), return a single concatenated character, otherwise returns a character vector

**Details**

This function can be useful when some special characters must be temporarily converted to another letter without being confused with the same letters used elsewhere.

Letters are first searched from `\u0001` upto `\uffff`. Do not specify too large `n`; An error is raised if a sufficient number of unused letters are not found.

**Value**

unused characters, format depends on `as_number` and `as_vector` arguments
