

# Package ‘sunburstR’

September 18, 2018

**Type** Package

**Title** 'Htmlwidget' for 'Kerry Rodden' 'd3.js' Sequence and 'd2b'  
Sunburst

**Version** 2.1.0

**Date** 2018-09-17

**Maintainer** Kent Russell <kent.russell@timelyportfolio.com>

**URL** <https://github.com/timelyportfolio/sunburstR>

**BugReports** <https://github.com/timelyportfolio/sunburstR/issues>

**Description** Make interactive 'd3.js' sequence sunburst diagrams in R with the convenience and infrastructure of an 'htmlwidget'.

**License** MIT + file LICENSE

**LazyData** TRUE

**Imports** d3r (>= 0.6.9), dplyr, htmlwidgets, htmltools

**Suggests** jsonlite, knitr, markdown, pipeR, testthat, tidyr (>= 0.7.0),  
rmarkdown

**Enhances** treemap

**RoxygenNote** 6.0.1

**VignetteBuilder** knitr

**NeedsCompilation** no

**Author** Mike Bostock [aut, cph] (d3.js library, <http://d3js.org>),  
Kerry Rodden [aut, cph] (sequences library in htmlwidgets/lib,  
<https://gist.github.com/kerryrodden/7090426>),  
Kevin Warne [aut, cph] (d2b sunburst library in htmlwidgets/lib,  
<https://github.com/d2bjs/d2b>),  
Kent Russell [aut, cre] (R interface),  
Florian Breitwieser [ctb] (R interface),  
CJ Yetman [ctb] (R interface, <<https://orcid.org/0000-0001-5099-9500>>)

**Repository** CRAN

**Date/Publication** 2018-09-18 04:40:03 UTC

## R topics documented:

| add_shiny | <i>Add Shiny Events</i> |
|-----------|-------------------------|

---

### Description

Add Shiny Events

### Usage

```
add_shiny(sunburst = NULL)
```

### Arguments

sunburst            sunburst htmlwidget to which you would like to add event handling

### Value

sunburst htmlwidget

### Examples

```
## Not run:

library(shiny)
library(sunburstR)

sequences <- read.csv(
  system.file("examples/visit-sequences.csv", package="sunburstR")
  ,header=F
  ,stringsAsFactors = FALSE
)

server <- function(input,output,session){

  output$sunburst <- renderSunburst({
    #invalidateLater(1000, session)

    sequences <- sequences[sample(nrow(sequences),1000),]
```

```
    add_shiny(sunburst(sequences))
  })

  selection <- reactive({
    input$sunburst_mouseover
  })

  output$selection <- renderText(selection())
}

ui<-fluidPage(
  sidebarLayout(
    sidebarPanel(

    ),

    # plot sunburst
    mainPanel(
      sunburstOutput("sunburst"),
      textOutput("selection")
    )
  )
)

shinyApp(ui = ui, server = server)

## End(Not run)
```

---

d2b-shiny

*Shiny bindings for d2b*

---

## Description

Output and render functions for using d2b within Shiny applications and interactive Rmd documents.

## Usage

```
sund2bOutput(outputId, width = "100%", height = "400px")
```

```
renderSund2b(expr, env = parent.frame(), quoted = FALSE)
```

## Arguments

|               |  |
|---------------|--|
| outputId      | output variable to read from   |
| width, height | Must be a valid CSS unit (like '100%', '400px', 'auto') or a number, which will be coerced to a string and have 'px' appended. |

|        |   |
|--------|---|
| expr   | An expression that generates a d2b  |
| env    | The environment in which to evaluate expr.  |
| quoted | Is expr a quoted expression (with quote())? This is useful if you want to save an expression in a variable. |

---

sunburst                      *'d3.js' Sequence Sunburst Diagrams*

---

## Description

**Sequences** `sunburst` diagrams provide an interactive method of exploring sequence data, such as website navigation paths.

## Usage

```
sunburst(data = NULL, legendOrder = NULL, colors = NULL,
  valueField = "size", percent = TRUE, count = FALSE,
  explanation = NULL, breadcrumb = list(), legend = list(),
  sortFunction = NULL, sumNodes = TRUE, withD3 = FALSE, width = NULL,
  height = NULL, elementId = NULL, sizingPolicy = NULL, csvdata = NULL,
  jsondata = NULL)
```

## Arguments

|             |  |
|-------------|--|
| data        | data in csv source,target form or in nested d3 JSON hierarchy with 'name:..., children:[];'. csvdata and jsondata arguments are now deprecated in favor of this single data argument. list, character, or connection data will be assumed to be JSON. data.frame data will be assumed to be csvdata and converted to JSON by <code>sunburstR::csv_to_hier()</code> . |
| legendOrder | string vector if you would like to manually order the legend. If legendOrder is not provided, then the legend will be in the descending order of the top level hierarchy.  |
| colors      | vector of strings representing colors as hexadecimal for manual colors. If you want precise control of colors, supply a list with range and/or domain. For advanced customization, supply a JavaScript function.   |
| valueField  | character for the field to use to calculate size. The default value is "size".   |
| percent     | logical to include percentage of total in the explanation.   |
| count       | logical to include count and total in the explanation.   |
| explanation | JavaScript function to define a custom explanation for the center of the sunburst. Note, this will override percent and count.   |
| breadcrumb  | list to customize the breadcrumb trail. This argument should be in the form <code>list(w =, h =, s =, t = )</code> where w is the width, h is the height, s is the spacing, and t is the tail all in px. w is 0 by default for breadcrumbs widths based on text length.  |

|               |   |
|---------------|---|
| legend        | list to customize the legend or logical to disable the legend. The list argument should be in the form <code>list(w =, h =, r =, s = )</code> where <code>w</code> is the width, <code>h</code> is the height, <code>s</code> is the spacing, and <code>r</code> is the radius all in px. |
| sortFunction  | JS function to sort the slices. The default sort is by size.  |
| sumNodes      | logical to sum non-leaf nodes. The default <code>sumNodes = TRUE</code> assumes that the user has not already calculated a sum.   |
| withD3        | logical to include d3 dependency from d3r. As of version 1.0, sunburst uses a standalone JavaScript build and will not include the entire d3 in the global/window namespace. To include d3.js in this way, use <code>withD3=TRUE</code> .   |
| height, width | height and width of sunburst htmlwidget containing div specified in any valid CSS size unit.  |
| elementId     | string id as a valid CSS element id.  |
| sizingPolicy  | see <a href="#">sizingPolicy</a> .  |
| csvdata       | deprecated use data argument instead; data in csv source,target form  |
| jsondata      | deprecated use data argument instead; data in nested d3 JSON hierarchy with <code>'name:..., children:[]'</code>  |

## Examples

```
library(sunburstR)

# read in sample visit-sequences.csv data provided in source
# only use first 100 rows to speed package build and check
# https://gist.github.com/kerryrodden/7090426#file-visit-sequences-csv
sequences <- read.csv(
  system.file("examples/visit-sequences.csv", package="sunburstR")
  ,header = FALSE
  ,stringsAsFactors = FALSE
)[1:100,]

sunburst(sequences)

## Not run:

# explore some of the arguments
sunburst(
  sequences
  ,count = TRUE
)

sunburst(
  sequences
  # apply sort order to the legends
  ,legendOrder = unique(unlist(strsplit(sequences[,1], "-")))
  # just provide the name in the explanation in the center
  ,explanation = "function(d){return d.data.name}"
)
```

```

# try with json data
sequence_json <- jsonlite::fromJSON(
  system.file("examples/visit-sequences.json", package="sunburstR"),
  simplifyDataFrame = FALSE
)
sunburst(sequence_json)

# try with csv data from this fork
# https://gist.github.com/mkajava/7515402
# great use for new breadbrumb wrapping
sunburst(
  csvdata = read.csv(
    file = paste0(
      "https://gist.githubusercontent.com/mkajava/",

sunburst-shiny

*Shiny bindings for sunburst*

---

## Description

Output and render functions for using sunburst within Shiny applications and interactive Rmd documents.

## Usage

```
sunburstOutput(outputId, width = "100%", height = "400px")
```

```
renderSunburst(expr, env = parent.frame(), quoted = FALSE)
```

**Arguments**

|               |  |
|---------------|--|
| outputId      | output variable to read from   |
| width, height | Must be a valid CSS unit (like '100%', '400px', 'auto') or a number, which will be coerced to a string and have 'px' appended. |
| expr          | An expression that generates a sunburst  |
| env           | The environment in which to evaluate expr.   |
| quoted        | Is expr a quoted expression (with quote())? This is useful if you want to save an expression in a variable.                    |

sund2b

*Sunburst Using 'd2b'***Description**

Create interactive sunburst chart with the 'd2b' charting library.

**Usage**

```
sund2b(data = NULL, colors = NULL, valueField = "size", width = NULL,
        height = NULL, elementId = NULL)
```

**Arguments**

|               |  |
|---------------|--|
| data          | data in csv source,target form or in nested d3 JSON hierarchy with 'name:..., children:[];'. list, character, or connection data will be assumed to be JSON. data.frame data will be assumed to be csvdata and converted to JSON by sunburstR:::csv_to_hier(). |
| colors        | vector of strings representing colors as hexadecimal for manual colors. If you want precise control of colors, supply a list with range and/or domain. For advanced customization, supply a JavaScript function.   |
| valueField    | character for the field to use to calculate size. The default value is "size".   |
| height, width | height and width of sunburst htmlwidget containing div specified in any valid CSS size unit.   |
| elementId     | string id as a valid CSS element id.   |

**Examples**

```
## Not run:

# The sund2b() API mirrors sunburst() with fewer arguments.

library(sunburstR)

# use a sample of the sequences csv data
sequences <- read.csv(
```

```

    system.file("examples/visit-sequences.csv", package="sunburstR")
    ,header = FALSE
    ,stringsAsFactors = FALSE
  )[1:200,]

# create a d2b sunburst
sund2b(sequences)

# change the colors
# using d3.js categorical color scheme
sund2b(
  sequences,
  colors = htmlwidgets::JS("d3.scaleOrdinal(d3.schemeCategory20b)")
)
# using RColorBrewer palette
sund2b(
  sequences,
  colors = list(range = RColorBrewer::brewer.pal(9, "Set3"))
)
# using a color column from the R dataset
# treemap has an amazing treecolors ability
library(treemap)
library(d3r)
