Package ‘synlik’

May 23, 2018

Type Package
Title Synthetic Likelihood Methods for Intractable Likelihoods
Version 0.1.2
Date 2018-05-22
Author Matteo Fasiolo and Simon Wood
Maintainer Matteo Fasiolo <matteo.fasiolo@gmail.com>
Description Framework to perform synthetic likelihood inference
       for models where the likelihood function is unavailable or
       intractable.
URL http://mfasioio.github.io/synlik_release
License GPL (>= 2)
Depends R (>= 2.10), Rcpp (>= 0.12.0)
Imports methods, graphics, Matrix, compiler, stats, parallel
Suggests knitr, stabledist
LinkingTo Rcpp, RcppArmadillo
VignetteBuilder knitr
RoxygenNote 5.0.1
NeedsCompilation yes
Repository CRAN
Date/Publication 2018-05-23 14:05:17 UTC

Synthetic Likelihood Methods for Intractable Likelihoods

Description

Package that provides Synthetic Likelihood methods for intractable likelihoods. The package is meant to be as general purpose as possible: as long as you are able to simulate data from your model you should be able to fit it.

Details

<table>

The package allows users to create objects of class synlik (S4), which are essentially constituted of a simulator function and a function (summaries) that transforms the data into summary statistics. The simulator can output any kind of data (vector, list, etc) and this will be passed directly to the summaries function. This allow the package to fit a large variety of models.

Once the model of interest has been set up as a synlik object, it is possible several methods on it. The function most useful function is slik, which can be used to evaluate the synthetic likelihood. The slice.synlik function allows to obtain and plot slices of the synthetic likelihood with respect
to model parameters. It is possible to simulate data or statistics from the model using the generic simulate, and to check the normality of the statistics using the checkNorm function. Unknown parameters can be estimated by MCMC, through the smcmc function. This function will return an object of class smcmc (S4), which contains all the inputs and results of the MCMC procedure.

Many functions in the package support parallel simulation on multiple cores.

For some examples see the Vignettes (type vignette("synlik").

Examples

```r
## Not run:
#### Here I put a simple example, 
#### if you want to see more type: vignette("synlik")

## End(Not run)

#### Create synlik object
ricker_sl <- synlik(simulator = rickerSimul,
  summaries = rickerStats,
  param = c(logR = 3.8, logSigma = log(0.3), logPhi = log(10)),
  extraArgs = list("nObs" = 50, "nBurn" = 50),
  plotFun = function(input, ...){
    plot(drop(input), type = 'l', ylab = "Pop", xlab = "Time", ...)
  }
)

#### Simulate from the object
ricker_sl@data <- simulate(ricker_sl)
ricker_sl@extraArgs$obsData <- ricker_sl@data

#### Simulate statistics (each row is a vector of statistics)
simulate(ricker_sl, seed = 523, nsim = 10, stats = TRUE)

#### Plotting the data
plot(ricker_sl)

#### Checking multivariate normality of the statistics
```
checkNorm(ricker_sl)

### Evaluate the likelihood
set.seed(4234)
slik(ricker_sl,  
  param = c(logR = 3.8, logSigma = log(0.3), logPhi = log(10)),  
  nsim = 1e3)

### Plotting a slice of the log-Likelihood possibly using multiple cores
slice(object = ricker_sl,  
  ranges = list("logR" = seq(3.5, 3.9, by = 0.02),  
                 "logPhi" = seq(2, 2.6, by = 0.02),  
                 "logSigma" = seq(-2, -0.5, by = 0.05)),  
  param = c(logR = 3.8, logSigma = log(0.3), logPhi = log(10)),  
  nsim = 500, multicore = FALSE)

### MCMC estimation possibly using multiple cores
set.seed(4235)
ricker_sl <- smcmc(ricker_sl,  
  initPar = c(3.2, -1, 2.6),  
  niter = 50,  
  burn = 3,  
  priorFun = function(input, ...) 0,  
  propCov = diag(c(0.1, 0.1, 0.1))^2,  
  nsim = 1e3,  
  multicore = FALSE)

# Continue with additional 50 iterations
ricker_sl <- continue(ricker_sl, niter = 50)

# Plotting results on transformed scale (exponential)
trans <- rep("exp", 3)
names(trans) <- names(ricker_sl@param)

plot(ricker_sl)

---

**ANYOrNULL-class**  
**Dummy class**

**Description**

Class unions for internal use only
**Nicholson’s 1954 blowfly data**

**Description**

Data from figures 3 and 4 of Nicholson, 1954.

**Usage**

```r
data(bf1)
```

**Arguments**

- `bf1` the dataset name

**Details**

`bf1` is Nisbet and Gurney’s run 1, and Nicholson’s (1954) figure 3 (adult food limitation). The data are actually from the global population dynamics database at Silwood. They are daily: Nicholson’s figure 3 plots data every other day, but the text says that measurements were taken daily. However elsewhere they are reported every other day. Probably best to assume that they have been interpolated to daily.

`bf2` and `bf3` are digitized from Nicholson’s (1954) figure 4. `bf2` is the upper series: larval food limitation, with 50g per day of larval food provided. `bf3` is the lower series: same set up, half as much food. These are Nisbet and Gurney’s runs 2 and 3, respectively.

**Value**

matrix of replicate data series

**Author(s)**

Simon N. Wood, maintainer Matteo Fasiolo <matteo.fasiolo@gmail.com>

**References**

`blowfly`
Examples

```r
library(synlik)
data(bf1)
data(bf2)
data(bf3)
par(mfrow=c(3,1),mar=c(4,4,1,1))
with(bf1,plot(day, pop, type="l"))
with(bf1,points(day, pop, pch=20, cex=.8))
abline(mean(bf1$pop), 0, col=2); abline(median(bf1$pop), 0, col=3);
with(bf2,plot(day, pop, type="l"))
with(bf2,points(day, pop, pch=20, cex=.8))
abline(mean(bf2$pop), 0, col=2); abline(median(bf2$pop), 0, col=3);
with(bf3,plot(day, pop, type="l"))
with(bf3,points(day, pop, pch=20, cex=.8))
abline(mean(bf3$pop), 0, col=2); abline(median(bf3$pop), 0, col=3);
```

---

**blowSimul**  
*Simulates from the blowfly model*

**Description**
Simulator for the blowfly model proposed by Wood (2010).

**Usage**

`blowSimul(param, nsim, extraArgs, ...)`

**Arguments**

- `param` vector of log-parameters: `delta`, `P`, `N0`, `var.p`, `tau` and `var.d`. The interpretation of these parameters is described in Wood (2010).
- `nsim` Number of simulations from the model.
- `extraArgs` A named list of additional arguments:
  - `nobs` = Length of each simulated time series.
  - `nburn` = Number of initial steps to be discarded before saving the following `nobs` steps.
  - `steps` = Positive integer. If `steps` == `n` the observations correspond to `n` time steps.

**Value**
A matrix `nsim` by `nobs`, where each row is a simulated path.

**Author(s)**
Simon Wood and Matteo Fasiolo <matteo.fasiolo@gmail.com>.

blow_simul

Examples

tmp <- blow_simul(param = log(c("delta" = 0.16, "P" = 6.5, "N0" = 400,
                        "var.P" = 0.1, "tau" = 14, "var.d" = 0.1)),
              nsim = 2,
              extraArgs = list("nObs" = 200, "nBurn" = 1000, "steps" = 2))
matplot(t(tmp), type = 'l', ylab = "Y", xlab = "Time")

Description

synlik object containing the blowfly model proposed by Wood (2010). The main components are the simulator blowSimul and the statistics blowStats, described in the same reference.

Author(s)

Simon Wood and Matteo Fasiolo <matteo.fasiolo@gmail.com>.

blowSimul
Examples

data(blow_sl)

plot(blow_sl)
simulate(blow_sl, stats = TRUE)

slik(blow_sl, 
    param = log(c("delta" = 0.16, "p" = 6.5, "N0" = 400, 
                 "var.p" = 0.1, "tau" = 14, "var.d" = 0.1)), 
    nsim = 1e3)

# Using Nicholson’s data
data(bf1)

plot(blow_sl)

blow_sl@data <- bf1$pop
blow_sl@extraArgs$obsData <- bf1$pop #Important: blow_sl@blowStats uses the observed data

slik(blow_sl, 
    param = log(c("delta" = 0.16, "p" = 6.5, "N0" = 400, 
                 "var.p" = 0.1, "tau" = 14, "var.d" = 0.1)), 
    nsim = 1e3)

checkNorm

Checking the multivariate normal approximation.

Description

Given an object of class synlik this routine provides a graphical check of whether the distribution of the random summary statistics is multivariate normal.

Usage

checkNorm(object, param = object@param, nsim = 1000, observed = NULL, 
           cex.axis = 1, cex.lab = 1, ...)

Arguments

object An object of class synlik or a matrix where each row is a random vector.
param A vector of model’s parameters at which the summary statistics will be simulated.
nsim number of summary statistics to be simulated if object is of class synlik, otherwise it is not used.
observed A vector of observed summary statistics. By default NULL, so object@data will be used as observed statistics. It will be looked at only if object is a matrix.
cex.axis Axis scale expansion factor.
checkNorm

Axis label expansion factor.

... additional arguments to be passed to object@simulator and object@summaries. In general I would avoid using it and including in object@extraArgs everything they need.

Details

The method is from section 7.5 of Krzanowski (1988). The replicate vectors of summary statistic S are transformed to variables which should be univariate chi squared r.v.s with DoF given by the number of rows of S. An appropriate QQ-plot is produced, and the proportion of the data differing substantially from the ideal line is reported. Deviations at the right hand end of the plot indicate that the tail behaviour of the Normal approximation is poor: in the context of synthetic likelihood this is of little consequence. Secondly, s is transformed to a vector which should be i.i.d. N(0,1) under multivariate normality, and a QQ plot is produced. Unfortunately this approach is not very useful unless the dimension of s is rather large. In simulations, perfectly MVN data produce highly variable results, so that the approach lacks any real power.

Value

Mainly produces plots and prints output. Also an array indicating proportion of simulated statistics smaller than observed.

Author(s)

Simon N. Wood, maintained by Matteo Fasiolo <matteo.fasiolo@gmail.com>.

References

Examples

#### Create Object
data(ricker_sl)

#### Simulate from the object
ricker_sl@data <- simulate(ricker_sl)
ricker_sl@extraArgs$obsData <- ricker_sl@data

#### Checking multivariate normality
checkNorm(ricker_sl)

# With matrix input
checkNorm(matrix(rnorm(200), 100, 2))
**Description**

Generic function, that given the results of an estimation procedure (ex. MCMC or maximum likelihood optimization) continues the procedure for some more iterations.

**Usage**

```r
continue(object, ...) 
```

```r
## S4 method for signature 'smcmc'
continue(object, niter = object@niter, nsim = object@nsim, 
  propCov = object@propCov, targetRate = object@targetRate, 
  recompute = object@recompute, multicore = object@multicore, 
  ncores = object@ncores, cluster = NULL, control = object@control, ...)
```

**Arguments**

- `object` An object representing the results of an estimation procedure which we wish to continue. For example it might represents an MCMC chain.
- `...` additional arguments to be passed to `slik` function, see `slik`.
- `niter` see `smcmc-class`.
- `nsim` see `smcmc-class`.
- `propCov` see `smcmc-class`.
- `targetRate` see `smcmc-class`.
- `recompute` see `smcmc-class`.
- `multicore` see `smcmc-class`.
- `ncores` see `smcmc-class`.
- `cluster` an object of class c("SOCKcluster", "cluster"). This allows the user to pass her own cluster, which will be used if `multicore == TRUE`. The user has to remember to stop the cluster.
- `control` see `smcmc-class`.

**Details**

When `is("smcmc", object) == TRUE` continues MCMC estimation of an object of class `smcmc`. All input parameters are defaulted to the corresponding slots in the input object, with the exception of `cluster`. The chain restarts were it ended, burn-in is set to zero, the same prior (if any) is used.

**Value**

An object of the same class as `object`, where the results of the estimation have been updated.
**extractCorr**

*Extracting correlations from a covariance matrix*

**Description**

Extracting correlations from a covariance matrix

**Usage**

`extractCorr(mat)`

**Arguments**

- **mat** A covariance matrix.

**Value**

The correlation matrix embedded in `mat`.

**Examples**

```r
# 2 dimensional case
d <- 2
tmp <- matrix(rnorm(d^2), d, d)
mcov <- tcrossprod(tmp, tmp)

# Covariance matrix
mcov

# Correlation matrix
extractCorr(mcov)
```

**functionOrNULL-class**

*Dummy class*

**Description**

Class unions for internal use only
### internal_C

**Internal C and C++ function**

**Description**

This function is for internal use only.

**Author(s)**

Simon Wood and Matteo Fasiolo <matteo.fasiolo@gmail.com>.

---

### nlar

**Estimate non-linear autoregressive coefficients**

**Description**

Function that, given time series data, transforms them into summary statistics using polynomial autoregression.

**Usage**

\[ \text{nlar}(x, \text{lag}, \text{power}) \]

**Arguments**

- \( x \): a matrix. Each column contains a replicate series.
- \( \text{lag} \): vector of lags, for rhs terms.
- \( \text{power} \): vector of powers, for rhs terms.

**Value**

a matrix where each column contains the coefficients for a different replicate.

**Author(s)**

Simon N. Wood, maintainer Matteo Fasiolo <matteo.fasiolo@gmail.com>.
numericOrNULL-class

Examples

```r
library(synlik)
set.seed(10)
x <- matrix(runif(200),100,2)
beta <- nlar(x, lag=c(1,1), power=c(1,2))
y <- x[,1]
y <- y - mean(y)
z <- y[1:99]; y <- y[2:100]
lm(y-z+I(z^2)-1)
beta

## NA testing
x[5,1] <- x[45,2] <- NA
beta <- nlar(x, lag=c(1,1), power=c(1,2))
y <- x[,1]
y <- y - mean(y, na.rm=TRUE)
z <- y[1:99]; y <- y[2:100]
lm(y-z+I(z^2)-1)
beta

## higher order...
set.seed(10)
x <- matrix(runif(100),100,2)
beta <- nlar(x, lag=c(6,6,6,1,1), power=c(1,2,3,1,2))
k <- 2
y <- x[,k]
y <- y - mean(y)
ind <- (1+6):100
y6 <- y[ind-6]; y1 <- y[ind-1]; y <- y[ind]
beta0 <- coef(lm(y-y6+I(y6^2)+I(y6^3)+y1+I(y1^2)-1))
as.numeric(beta[,k]); beta0; beta0-as.numeric(beta[,k])
```

dummyClass

Description

Class unions for internal use only

orderDist

Summary marginal distribution of (differenced) series.

Description

Summarizes (difference) distribution of replicate series, by regressing ordered differenced series on a reference series (which might correspond to observed data).
Usage

orderDist(x, z, np = 3, diff = 1)

Arguments

x a matrix. Each column contains a replicate series.
z vector of lags, for rhs terms.
np maximum power on rhs of regression.
diff order of differencing (zero for none).

Value

a matrix where each column contains the coefficients for a different replicate.

Author(s)

Simon N. Wood, maintainer Matteo Fasiolo <matteo.fasiolo@gmail.com>.

Examples

library(synlik)
set.seed(10)
n <- 100; nr <- 3
x <- matrix(runif(n*nr), n,nr)
z <- runif(n)
beta <- orderDist(x,z,np=3,diff=1)
zd <- z; xd <- x[,3]
zd <- diff(zd,1); xd <- diff(xd,1)
zd <- sort(zd); zd <- zd - mean(zd)
zd <- sort(xd); xd <- xd - mean(xd)
lm(xd~zd+I(zd^2)+I(zd^3)-1)
**Arguments**

- **x**: An object of class `smcmc`.
- **trans**: Name list or vector containing names of transforms for some parameters (ex: `list("par1" = "exp", "par2" = "log")`). The transformations will be applied before plotting.
- **addPlot1**: Name of additional plotting function that will be call after the MCMC chain have been plotted. It has to have prototype `fun(nam, ...)` where `nam` will be the parameter name. See "examples".
- **addPlot2**: Name of additional plotting function that will be call after the histograms have been plotted. It has to have prototype `fun(nam, ...)` where `nam` will be the parameter name. See "examples".
- ... additional arguments to be passed to the plotting functions.

**See Also**

`smcmc-class`, `plot`.

**Examples**

```r
data(ricker_smcmc)

# Functions for additional annotations (true parameters)
addline1 <- function(parNam, ...){
  abline(h = exp(ricker_smcmc@param[parNam]), lwd = 2, lty = 2, col = 3)
}
addline2 <- function(parNam, ...){
  abline(v = exp(ricker_smcmc@param[parNam]), lwd = 2, lty = 2, col = 3)
}

# Transformations (exponentials)
trans <- rep("exp", 3)
names(trans) <- names(ricker_smcmc@param)

plot(ricker_smcmc, trans = trans, addPlot1 = "addline1", addPlot2 = "addline2")
```

---

**plot-synlik**

*Method for plotting an object of class synlik.*

**Description**

It basically calls the slot `object@plotFun` with input `object@data`, if it has been provided by the user. Otherwise it tries to use the `plot(x = object@data, y, ...)` generic.
Usage

```r
## S4 method for signature 'synlik,missing'
plot(x, y, ...)
```

Arguments

- `x` An object of class `synlik`.
- `y` Useless argument, only here for compatibility reasons.
- `...` additional arguments to be passed to `object@plotFun`.

Author(s)

Matteo Fasiolo <matteo.fasiolo@gmail.com>

See Also

- `synlik-class`, `plot`

Examples

```r
data(ricker_sl)

# Using ricker_sl@plotFun
plot(ricker_sl)

# Using generic plot, doesn't work well because object@data is a matrix.
ricker_sl@plotFun <- NULL
plot(ricker_sl)
```

---

**rickerSimul**  
Simulates from the ricker model

Description

Simulator for the stochastic Ricker model, as described by Wood (2010). The observations are \( Y_t \sim \text{Pois}(\Phi \times N_t) \), and the dynamics of the hidden state are given by \( N_t = r \times N_{(t-1)} \times \exp(-N_{(t-1)} + e_t) \), where \( e_t \sim \text{N}(0, \sigma^2) \).

Usage

```r
rickerSimul(param, nsim, extraArgs, ...)
```
Arguments

param vector of log-parameters: logR, logSigma, logPhi. Alternatively a matrix nsim by 3 were each row is a different parameter vector.

nsim Number of simulations from the model.

extraArgs A named list of additional arguments:

• n0bs = Length of each simulated time series.
• nburn = Number of initial steps to be discarded before saving the following n0bs steps.
• randInit = if TRUE (default) the initial state N0 is runif(0, 1), otherwise it is equal to extraArgs$initVal.
• initVal = initial value N0, used only if extraArgs$randInit == TRUE.

Value

A matrix nsim by n0bs, where each row is a simulated path.

Author(s)

Simon Wood and Matteo Fasiolo <matteo.fasiolo@gmail.com>.

Examples

tmp <- rickerSimul(c(3.8, -1.2, 2.3), nsim = 2, extraArgs = list("nObs" = 50, "nBurn" = 200))
matplot(t(tmp), type = 'l', ylab = "Y", xlab = "Time"

parMat <- rbind(c(3.8, -1.2, 2.3), # Chaotic
c(2.5, -1.2, 2.3)) # Not Chaotic

par(mfrow = c(2, 1))
tmp <- rickerSimul(parMat, nsim = 2, extraArgs = list("nObs" = 50, "nBurn" = 200))
plot(tmp[, 1], type = 'l', ylab = "Y", xlab = "Time")
plot(tmp[, 2], type = 'l', ylab = "Y", xlab = "Time")
ricker_sl  

**Ricker model**

**Description**

ricker_sl is synlik object containing the stochastic Ricker model, ricker_smcmc is a smcmc object which also contains the results of some MCMC iterations. The model is described rickerSimul and in Wood (2010). The main components of the object are the simulator rickerSimul and the statistics rickerStats, described in the same reference.

**Author(s)**

Simon Wood and Matteo Fasiolo <matteo.fasiolo@gmail.com>.

**References**

**See Also**

rickerSimul

**Examples**

data(ricker_sl)

plot(ricker_sl)
simulate(ricker_sl, stats = TRUE)

slik(ricker_sl,  
   param = c( logR = 3.8, logSigma = log(0.3), logPhi = log(10) ),  
   nsim = 1e3)

# Using Nicholson's data  
data(ricker_smcmc)

plot(ricker_smcmc)
Description

Usage

robCov(sY, alpha = 2, beta = 1.25)

Arguments

- **sY**: A matrix, where each column is a replicate observation on a multivariate r.v.
- **alpha**: tuning parameter, see details.
- **beta**: tuning parameter, see details.

Details

Campbell (1980) suggests an estimator of the covariance matrix which downweights observations at more than some Mahalanobis distance \( d_0 \) from the mean. \( d_0 \) is \( \sqrt{nrow(sY)+alpha/sqrt(2)} \).

Weights are one for observations with Mahalanobis distance, \( d \), less than \( d_0 \). Otherwise weights are \( d_0*exp(-.5*(d-d_0)^2/beta)/d \). The defaults are as recommended by Campbell. This routine also uses pre-conditioning to ensure good scaling and stable numerical calculations.

Value

A list where:

- **E**: a square root of the inverse covariance matrix. i.e. the inverse cov matrix is \( t(E)*E \);
- **halfIlogdetY**: Half the log of the determinant of the covariance matrix;
- **my**: The estimated mean;
- **sd**: The estimated standard deviations of each variable.

Author(s)

Simon N. Wood, maintained by Matteo Fasiolo <matteo.fasiolo@gmail.com>.

References

Examples

```r
p <- 5; n <- 100
Y <- matrix(runif(p*n), p, n)
robCov(Y)
```
Simulate data or statistics from an object of class synlik.

Description

Simulate data or statistics from an object of class synlik.

Usage

```r
## S4 method for signature 'synlik'
simulate(object, nsim = NULL, seed = NULL, param = object@param,
         stats = FALSE, clean = TRUE, verbose = TRUE, ...)  
```

Arguments

- **object**: An object of class synlik.
- **nsim**: Number of simulations from the model.
- **seed**: Random seed to be used. It is not passed to the simulator, but simply passed to `set.seed()` from within `simulate.synlik`.
- **param**: Vector of parameters passed to `object@simulator`.
- **stats**: If `TRUE` the function transforms the simulated data into statistics using `object@summaries`.
- **clean**: If `TRUE` the function tries to clean the statistics from NaNs or non-finite values. Given that `object@summaries` has to return a numeric vector or a matrix where each row is a simulation, rows containing non-finite values will be discarded.
- **verbose**: If `TRUE` the function will complain if, for instance, the simulations contain lots of non-finite values.
- **...**: Additional arguments to be passed to `object@simulator` and `object@summaries`. In general I would avoid using it and including `object@extraArgs` everything they need.

Value

If `stats == FALSE` the output will be that of `object@simulator`, which depends on the simulator used by the user. If `stats == TRUE` the output will be a matrix where each row is vector of simulated summary statistics.

Author(s)

Matteo Fasiolo <matteo.fasiolo@gmail.com>

`synlik-class, simulate.`
Examples

```r
data(ricker_sl)

# Simulate data
simulate(ricker_sl, nsim = 2)

# Simulate statistics
simulate(ricker_sl, nsim = 2, stats = TRUE)
```

---

**slAcf**  
*Estimate auto-covariances for multiple datasets.*

Description

Function that, given time series data, transforms them into auto-covariances with different lags.

Usage

```r
slAcf(x, max.lag = 10)
```

Arguments

- `x`: a matrix. Each column contains a replicate series.
- `max.lag`: How many lags to use.

Value

A matrix where each column contains the coefficients for a different replicate. The first coefficient corresponds to lag == 0, hence it is the variance, the second is the covariance one step ahead and so on.

Author(s)

Simon N. Wood, maintainer Matteo Fasiolo <matteo.fasiolo@gmail.com>.

Examples

```r
library(synlik)
set.seed(10)
x <- matrix(runif(1000),100,10)
acf <- slAcf(x)
```
slice  

Plot slices of the synthetic log-likelihood.

Description

Plot slices of the synthetic log-likelihood.

Usage

slice(object, ranges, nsim, param = object@param, pairs = FALSE, 
draw = TRUE, trans = NULL, multicore = FALSE, ncores = detectCores() - 
1, cluster = NULL, ...)

Arguments

- object: synlik object.
- ranges: ranges of values along which we want the slices. If length(parName) == 1 than range has a vector, while if length(parName) == 2 it have to be a named list of 2 vectors (ex: list("alpha" = 1:10, "beta" = 10:1)).
- nsim: Number of simulations used to evaluate the synthetic likelihood at each location.
- param: Named vector containing the value of the ALL parameters (including the sliced one). Parameters that are not in parName will be fixed to the values in param.
- pairs: if TRUE the function will produce a 2D slice for every pair of parameters in ranges. FALSE by default.
- draw: If TRUE the slice will be plotted.
- trans: Named vector or list of transformations to be applied to the parameters in parName before plotting ex: trans = c(s = "exp", d = "exp")/
- multicore: If TRUE the object@simulator and object@summaries functions will be executed in parallel. That is the nsim simulations will be divided in multiple cores.
- ncores: Number of cores to use if multicore == TRUE.
- cluster: An object of class c(" SOCKcluster", " cluster"). This allows the user to pass her own cluster, which will be used if multicore == TRUE. The user has to remember to stop the cluster.
- ... additional arguments to be passed to slik(), see slik.

Value

Either a vector or matrix of log-synthetic likelihood estimates, depending on whether length(parNames) == 1 or 2. These are returned invisibly.

Examples

data(ricker_sl)

# Plotting slices of the loglikelihood
slice(object = ricker_sl, 
      ranges = list("logR" = seq(3.5, 3.9, by = 0.01), 
                  "logPhi" = seq(2, 2.6, by = 0.01), 
                  "logSigma" = seq(-2, -0.5, by = 0.01)), 
      param = c(logR = 3.8, logSigma = log(0.3), logPhi = log(10)), 
      nsim = 500)

## Not run:
# Plotting a contour of the loglikelihood
slice(object = ricker_sl, 
      ranges = list("logR" = seq(3.5, 3.9, by = 0.01), 
                  "logPhi" = seq(2, 2.6, by = 0.01), 
                  "logSigma" = seq(-2, -0.5, by = 0.04)), 
      pairs = TRUE, 
      param = c(logR = 3.8, logSigma = log(0.3), logPhi = log(10)), 
      nsim = 500, multicore = TRUE)

## End(Not run)

---

**slik**

Evaluates the synthetic log-likelihood.

### Description

Evaluates the synthetic log-likelihood.

### Usage

`slik(object, param, nsim, multicore = FALSE, ncores = detectCores() - 1, 
     cluster = NULL, ...)`

### Arguments

- `object`: An object of class `synlik`.
- `param`: Vector of parameters at which the synthetic likelihood will be evaluated.
- `nsim`: Number of simulation from the model.
- `multicore`: (logical) if TRUE the `object@simulator` and `object@summaries` functions will be executed in parallel. That is the `nsim` simulations will be divided in multiple cores.
- `ncores`: (integer) number of cores to use if `multicore` == TRUE.
- `cluster`: an object of class `c("SOCKcluster", "cluster")`. This allows the user to pass her own cluster, which will be used if `multicore` == TRUE. The user has to remember to stop the cluster.
additional arguments to be passed to `object@simulator` and `object@summaries`. In general I would avoid using it and including `object@extraArgs` everything they need.

### Value

The estimated value of the synthetic log-likelihood at `param`.

### Author(s)

Matteo Fasiolo <matteo.fasiolo@gmail.com>

### References

### Examples

```r
data(ricker_sl)
set.seed(643)
slk(ricker_sl, param = c(3.8, -1.2, 2.3), nsim = 500)
```

---

**smcmc**  
*MCMC parameter estimation for objects of class synlik.*

### Description

MCMC parameter estimation for objects of class `synlik`.

### Usage

```r
smcmc(object, initPar, niter, nsim, propCov, burn = 0, 
      priorFun = function(param, ...) 0, targetRate = NULL, recompute = FALSE, 
      multicore = !is.null(cluster), cluster = NULL, ncores = detectCores() - 1, 
      control = list(), ...)
```

### Arguments

- `object`  
  An object of class `synlik`.
- `initPar`  
  see `smcmc-class`.
- `niter`  
  see `smcmc-class`.
- `nsim`  
  see `smcmc-class`.
- `propCov`  
  see `smcmc-class`.
- `burn`  
  see `smcmc-class`.
- `priorFun`  
  see `smcmc-class`. 
targetRate see smcmc-class.
recompute see smcmc-class.
multicore see smcmc-class.
cluster an object of class c("SOCKcluster", "cluster"). This allows the user to pass her own cluster, which will be used if multicore == TRUE. The user has to remember to stop the cluster.
ncores see smcmc-class.
control see smcmc-class.
... additional arguments to be passed to slik function, see slik.

Value
An object of class smcmc.

Author(s)
Matteo Fasiolo <matteo.fasiolo@gmail.com>, code for adaptive step from the adaptMCMC package.

References

---

Description
Object representing the results of MCMC estimation on an object of class synlik, from which it inherits.

Slots
initPar Vector of initial parameters where the MCMC chain will start (numeric).
niter Number of MCMC iterations (integer).
nsim Number of simulations from the simulator at each step of the MCMC algorithm (integer).
burn Number of initial MCMC iterations that are discarded (integer).
priorFun Function that takes a vector of parameters as input and the log-density of the prior as output. If the output is not finite the proposed point will be discarded. (function). The function needs to have signature fun(x, ...), where x represents the input parameters (function).
propCov Matrix representing the covariance matrix to be used to perturb the parameters at each step of the MCMC chain (matrix).
**targetRate**  Target rate for the adaptive MCMC sampler. Should be in \((0, 1)\), default is NULL (no adaptation). The adaptation uses the approach of Vihola (2011). (numeric)

**recompute**  If TRUE the synthetic likelihood will be evaluated at the current and proposed positions in the parameter space (thus doubling the computational effort). If FALSE the likelihood of the current position won’t be re-estimated (logical).

**multicore**  If TRUE the `object@simulator` and `object@summaries` functions will be executed in parallel. That is the `nsim` simulations will be divided in multiple cores (logical).

**ncores**  Number of cores to use if multicore == TRUE (integer).

**accRate**  Acceptance rate of the MCMC chain, between 0 and 1 (numeric).

**chains**  Matrix of size `niter` by `length(initPar)` where the i-th row contains the position of the MCMC algorithm in the parameter space at the i-th iteration (matrix).

**llkChain**  Vector of `niter` elements where the i-th element is contains the estimate of the synthetic likelihood at the i-th iteration (numeric).

**control**  Control parameters used by the MCMC sampler:

-  `theta` = controls the speed of adaption. Should be between 0.5 and 1. A lower gamma leads to faster adaption.
-  `adaptStart` = iteration where the adaption starts. Default 0.
-  `adaptStop` = iteration where the adaption stops. Default `burn + niter`
-  `saveFile` = path to the file where the intermediate results will be stored (ex: "~/Res.RData").
-  `saveFreq` = frequency with which the intermediate results will be saved on `saveFile`. Default 100.
-  `verbose` = if TRUE intermediate posterior means will be printer.
-  `verbFreq` = frequency with which the intermediate posterior means will be printer. Default 500.

**Examples**

```r
# Load "synlik" object
data(ricker_sl)
plot(ricker_sl)

# MCMC estimation
set.seed(4235)
riker_sl <- smcmc(ricker_sl,
    initPar = c(3.2, -1, 2.6),
    niter = 50,
    burn = 3,
```
Description

Basic class for simulation-based approximate inference using Synthetic Likelihood methods.

Usage

```r
synlik(...)```

Arguments

```r
...  
See section "Slots".
```

Slots

- `param` Named vector of parameters used by `object@simulator` (numeric).
- `simulator` Function that simulates from the model (function). It has to have prototype `fun(param, nsim, extraArgs, ...)`. If `summaries()` is not specified the `simulator()` has output a matrix with `nsim` rows, where each row is a vector of simulated statistics. Otherwise it can output any kind of object, and this output will be passed to `summaries()`.
- `summaries` Function that transforms simulated data into summary statistics (function). It has to have prototype `fun(x, extraArgs, ...)` and it has to output a matrix with `nsim` rows, where each row is a vector of simulated statistics. Parameter `x` contains the data.
- `data` Object containing the observed data or statistics (ANY).
- `extraArgs` List containing all the extra arguments to be passed to `object@simulator` and `object@summaries` (list).
- `plotFun` Function that will be used to plot `object@data`. Prototype should be `fun(x, ...)` (function).

Examples

```r
### Create Object
ricker_sl <- synlik(simulator = rickerSimul,
                    summaries = rickerStats,
                    param = c( logR = 3.8, logSigma = log(0.3), logPhi = log(10) ),
                    extraArgs = list("nObs" = 50, "nBurn" = 50),
                    plotFun = function(input, ...)
                      plot(drop(input), type = 'l', ylab = "Pop", xlab = "Time", ...)
)

# Simulate from the object
ricker_sl@data <- simulate(ricker_sl)
ricker_sl@extraArgs$obsData <- ricker_sl@data # Needed by WOOD2010 statistics

plot(ricker_sl)
```
