Package ‘tarchetypes’
October 14, 2022

Title  Archetypes for Targets

Description  Function-oriented Make-like declarative workflows for
Statistics and data science are supported in the ‘targets’ R package.
As an extension to ‘targets’, the ‘tarchetypes’ package provides
convenient user-side functions to make ‘targets’ easier to use.
By establishing reusable archetypes for common kinds of
targets and pipelines, these functions help express complicated
reproducible workflows concisely and compactly.
The methods in this package were influenced by the ‘drake’ R package

tarchetypes-package

**targets: Archetypes for Targets**

**Description**

A pipeline toolkit for R, the targets package brings together function-oriented programming and Make-like declarative pipelines for Statistics and data science. The tarchetypes package provides convenient helper functions to create specialized targets, making pipelines in targets easier and cleaner to write and understand.

**tar_age**

Create a target that runs when the last run gets old

**Description**

`tar_age()` creates a target that reruns itself when it gets old enough. In other words, the target reruns periodically at regular intervals of time.

**Usage**

```r
 tar_age(
   name,  
   command,  
   age,  
   pattern = NULL,  
   tidy_eval = targets::tar_option_get("tidy_eval"),  
   packages = targets::tar_option_get("packages"),  
   library = targets::tar_option_get("library"),  
   format = targets::tar_option_get("format"),
)```
repository = targets::tar_option_get("repository"),
iteration = targets::tar_option_get("iteration"),
error = targets::tar_option_get("error"),
memory = targets::tar_option_get("memory"),
garbage_collection = targets::tar_option_get("garbage_collection"),
deployment = targets::tar_option_get("deployment"),
priority = targets::tar_option_get("priority"),
resources = targets::tar_option_get("resources"),
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

Arguments

name Character of length 1, name of the target.
command R code to run the target and return a value.
age A `difftime` object of length 1, such as `as.difftime(3, units = "days")`. If the
target's output data files are older than `age` (according to the most recent
time stamp over all the target's output files) then the target will rerun. On the
other hand, if at least one data file is younger than `Sys.time() - age`, then the
ordinary invalidation rules apply, and the target may or not rerun. If you want
to force the target to run every 3 days, for example, set `age = as.difftime(3,
units = "days")`.
pattern Language to define branching for a target. For example, in a pipeline with
numeric vector targets `x` and `y`, `tar_target(z, x + y, pattern = map(x, y))` im-
plicitly defines branches of `z` that each compute `x[1] + y[1], x[2] + y[2]`, and
so on. See the user manual for details.
tidy_eval Logical, whether to enable tidy evaluation when interpreting `command` and `pattern`. If TRUE, you can use the "bang-bang" operator `!!` to programmatically insert the
values of global objects.
packages Character vector of packages to load right before the target builds or the output
data is reloaded for downstream targets. Use `tar_option_set()` to set pack-
ages globally for all subsequent targets you define.
library Character vector of library paths to try when loading packages.
format Logical, whether to rerun the target if the user-specified storage format changed.
The storage format is user-specified through `tar_target()` or `tar_option_set()`.
repository Logical, whether to rerun the target if the user-specified storage repository changed.
The storage repository is user-specified through `tar_target()` or `tar_option_set()`.
iteration Logical, whether to rerun the target if the user-specified iteration method changed.
The iteration method is user-specified through `tar_target()` or `tar_option_set()`.
error Character of length 1, what to do if the target stops and throws an error. Options:
  • "stop": the whole pipeline stops and throws an error.
  • "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)

• "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

**memory**

Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unload the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

**garbage_collection**

Logical, whether to run `base::gc()` just before the target runs.

**deployment**

Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

**priority**

Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

**resources**

Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

**storage**

Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

• "main": the target's return value is sent back to the host machine and saved/uploaded locally.

• "worker": the worker saves/uploads the value.

• "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target's command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to `tar_path()` from inside the target. An example target could look something like `tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")`. The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically
try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval Character of length 1, only relevant to `tar_make_clusterpq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target's dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue A `targets::tar_cue()` object. (See the "Cue objects" section for background.) This cue object should contain any optional secondary invalidation rules, anything except the mode argument. mode will be automatically determined by the age argument of `tar_age()`.

Details

tar_age() uses the cue from `tar_cue_age()`, which uses the time stamps from `targets::tar_meta()`$time. See the help file of `targets::tar_timestamp()` for an explanation of how this time stamp is calculated.

Value

A target object. See the "Target objects" section for background.

Dynamic branches at regular time intervals

Time stamps are not recorded for whole dynamic targets, so `tar_age()` is not a good fit for dynamic branching. To invalidate dynamic branches at regular intervals, it is recommended to use `targets::tar_older()` in combination with `targets::tar_invalidate()` right before calling `tar_make()`. For example, `tar_invalidate(all_of(tar_older(Sys.time - as.difftime(1, units = "weeks"))))` # nolint invalidates all targets more than a week old. Then, the next `tar_make()` will rerun those targets.

Target objects

Most `tarchetypes` functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

See Also

Other cues: `tar_cue_age_raw()`, `tar_cue_age()`, `tar_cue_force()`, `tar_cue_skip()`
Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      library(tarchetypes)
      list(
        tarchetypes::tar_age(
          data,
          data.frame(x = seq_len(26)),
          age = as.difftime(0.5, units = "secs")
        )
      )
    })
  }
  targets::tar_make()
  Sys.sleep(0.6)
  targets::tar_make()
}
```
Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target's initial RNG state.

command R code to run the target.

tar_change R code for the upstream change-inducing target.
tidy_eval Whether to invoke tidy evaluation (e.g. the `!!` operator from `rlang`) as soon as the target is defined (before `tar_make()`). Applies to arguments `command` and `change`.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading `packages`.

format Optional storage format for the target's return value. With the exception of `format = "file"`, each target gets a file in `_targets/objects`, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository Character of length 1, remote repository for target storage. Choices:
- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the `endpoint` argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if `repository` is not "local" and `format` is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration Character of length 1, name of the iteration mode of the target. Choices:
- "vector": branching happens with `vctrs::vec_slice()` and aggregation happens with `vctrs::vec_c()`.
- "list": branching happens with `[[ ]]` and aggregation happens with `list()`.
- "group": dplyr::group_by()-like functionality to branch over subsets of a data frame. The target's return value must be a data frame with a special tar_group column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the tar_group() function to see how you can create the special tar_group column with dplyr::group_by().

**error**
Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

**memory**
Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unload the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

**garbage_collection**
Logical, whether to run base::gc() just before the target runs.

**deployment**
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

**priority**
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

**resources**
Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

**storage**
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
- "main": the target's return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends,
but each downstream target still attempts to load the data file (except when retrieval = "none").
If you select storage = "none", then the return value of the target's command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")'.
The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".
retrieval Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
• "main": the target's dependencies are loaded on the host machine and sent to the worker before the target builds.
• "worker": the worker loads the targets dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.
cue An optional object from tar_cue() to customize the rules that decide whether the target is up to date. Only applies to the downstream target. The upstream target always runs.

Details
tar_change() creates a pair of targets, one upstream and one downstream. The upstream target always runs and returns an auxiliary value. This auxiliary value gets referenced in the downstream target, which causes the downstream target to rerun if the auxiliary value changes. The behavior is cancelled if cue is tar_cue(depend = FALSE) or tar_cue(mode = "never").
Because the upstream target always runs, tar_outdated() and tar_visnetwork() will always show both targets as outdated. However, tar_make() will still skip the downstream one if the upstream target did not detect a change.

Value
A list of two target objects, one upstream and one downstream. The upstream one triggers the change, and the downstream one responds to it. See the "Target objects" section for background.

Target objects
Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.
For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**See Also**

Other targets with custom invalidation rules: `tar_download()`, `tar_force()`, `tar_skip()`

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      list(
        tarchetypes::tar_change(x, command = tempfile(), change = tempfile())
      )
    }))
  targets::tar_make()
  targets::tar_make()
}
```

---

**tar_combine**

*Static aggregation.*

**Description**

Aggregate the results of upstream targets into a new target.

**Usage**

```r
tar_combine(
  name,
  ..., command = vctrs::vec_c(....x),
  use_names = TRUE,
  pattern = NULL,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
```
resources = targets::tar_option_get("resources"),
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

Arguments

name Symbol, name of the new target.

... One or more target objects or list of target objects. Lists can be arbitrarily nested, as in list().

command R command to aggregate the targets. Must contain !!!.x where the arguments are to be inserted, where !!! is the unquote splice operator from rlang.

use_names Logical, whether to insert the names of the targets into the command when splicing.

pattern Language to define branching for a target. For example, in a pipeline with numeric vector targets x and y, tar_target(z, x + y, pattern = map(x, y)) implicitly defines branches of z that each compute x[1] + y[1], x[2] + y[2], and so on. See the user manual for details.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Optional storage format for the target’s return value. With the exception of format = "file", each target gets a file in _targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with vctrs::vec_slice() and aggregation happens with vctrs::vec_c().
- "list", branching happens with [[]] and aggregation happens with list().
"group": dplyr::group_by()-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special tar_group column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the tar_group() function to see how you can create the special tar_group column with dplyr::group_by().

error Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends,
but each downstream target still attempts to load the data file (except when retrieval = "none"). If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

• "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
• "worker": the worker loads the targets dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

Value

A new target object to combine the return values from the upstream targets. See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Other branching: tar_combine_raw(), tar_map2_count_raw(), tar_map2_count(), tar_map2_raw(), tar_map2_size_raw(), tar_map2_size(), tar_map2(), tar_map_rep_raw(), tar_map_rep(), tar_map(), tar_rep2_raw(), tar_rep2(), tar_rep_map_raw(), tar_rep_map(), tar_rep_raw(), tar_rep()
Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script(
      target1 <- targets::tar_target(x, head(mtcars))
      target2 <- targets::tar_target(y, tail(mtcars))
      target3 <- tarchetypes::tar_combine(
        new_target_name,
        target1,
        target2,
        command = bind_rows(!!!.x)
      )
      list(target1, target2, target3)
    )
  )
  targets::tar_manifest()
}
```

Description

Like `tar_combine()` except the name, command, and pattern arguments use standard evaluation.

Usage

```r
tar_combine_raw(
  name,
  ...,  # additional arguments
  command = expression(vctrs::vec_c(!!!.x)),
  use_names = TRUE,
  pattern = NULL,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>name</strong></td>
<td>Character, name of the new target.</td>
</tr>
<tr>
<td><strong>command</strong></td>
<td>Expression object, R command to aggregate the targets. Must contain <code>!!!.x</code> where the arguments are to be inserted, where <code>!!</code> is the unquote splice operator from <code>rlang</code>.</td>
</tr>
<tr>
<td><strong>use_names</strong></td>
<td>Logical, whether to insert the names of the targets into the command when splicing.</td>
</tr>
<tr>
<td><strong>pattern</strong></td>
<td>Similar to the <code>pattern</code> argument of <code>tar_target()</code> except the object must already be an expression instead of informally quoted code. <code>base::expression()</code> and <code>base::quote()</code> can produce such objects.</td>
</tr>
<tr>
<td><strong>packages</strong></td>
<td>Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use <code>tar_option_set()</code> to set packages globally for all subsequent targets you define.</td>
</tr>
<tr>
<td><strong>library</strong></td>
<td>Character vector of library paths to try when loading packages.</td>
</tr>
<tr>
<td><strong>format</strong></td>
<td>Optional storage format for the target's return value. With the exception of <code>format = &quot;file&quot;</code>, each target gets a file in <code>_targets/objects</code>, and each format is a different way to save and load this file. See the &quot;Storage formats&quot; section for a detailed list of possible data storage formats.</td>
</tr>
<tr>
<td><strong>repository</strong></td>
<td>Character of length 1, remote repository for target storage. Choices:</td>
</tr>
<tr>
<td></td>
<td>• &quot;local&quot;: file system of the local machine.</td>
</tr>
<tr>
<td></td>
<td>• &quot;aws&quot;: Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of <code>tar_resources_aws()</code>, but versioning capabilities may be lost in doing so. See the cloud storage section of <a href="https://books.ropensci.org/targets/data.html">https://books.ropensci.org/targets/data.html</a> for details for instructions.</td>
</tr>
<tr>
<td></td>
<td>• &quot;gcp&quot;: Google Cloud Platform storage bucket. See the cloud storage section of <a href="https://books.ropensci.org/targets/data.html">https://books.ropensci.org/targets/data.html</a> for details for instructions.</td>
</tr>
<tr>
<td><strong>iteration</strong></td>
<td>Character of length 1, name of the iteration mode of the target. Choices:</td>
</tr>
<tr>
<td></td>
<td>• &quot;vector&quot;: branching happens with <code>vctrs::vec_slice()</code> and aggregation happens with <code>vctrs::vec_c()</code>.</td>
</tr>
<tr>
<td></td>
<td>• &quot;list&quot;: branching happens with <code>[]</code> and aggregation happens with <code>list()</code>.</td>
</tr>
<tr>
<td></td>
<td>• &quot;group&quot;: <code>dplyr::group_by()</code>-like functionality to branch over subsets of a data frame. The target's return value must be a data frame with a special <code>tar_group</code> column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the <code>tar_group()</code> function to see how you can create the special <code>tar_group</code> column with <code>dplyr::group_by()</code>.</td>
</tr>
</tbody>
</table>

Note: if `repository` is not "local" and `format` is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.
Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

Logical, whether to run base::gc() just before the target runs.

Character of length 1, only relevant to tar_make_cluster() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

Character of length 1, only relevant to tar_make_cluster() and tar_make_future(). Must be one of the following values:

- "main": the target's return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target's command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to
tar_combine_raw

tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE));
"ignored", storage = "none")'.

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval Character of length 1, only relevant to tar_make_cluster mq() and tar_make_future(). Must be one of the following values:
• "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
• "worker": the worker loads the targets dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

Value

A new target object to combine the return values from the upstream targets. See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

list(target1, target2, target3)
})
targets::tar_manifest()
})
}
```

---

**tar_cue_age**  
*Cue to run a target when the last output reaches a certain age*

**Description**

`tar_cue_age()` creates a cue object to rerun a target if the most recent output data becomes old enough. The age of the target is determined by `targets::tar_timestamp()`, and the way the time stamp is calculated is explained in the Details section of the help file of that function.

**Usage**

```r
tar_cue_age(
  name,
  age,
  command = TRUE,
  depend = TRUE,
  format = TRUE,
  repository = TRUE,
  iteration = TRUE,
  file = TRUE
)
```

**Arguments**

- **name**  
  Symbol, name of the target.

- **age**  
  A `difftime` object of length 1, such as `as.difftime(3, units = "days").` If the target’s output data files are older than age (according to the most recent time stamp over all the target’s output files) then the target will rerun. On the other hand, if at least one data file is younger than `Sys.time() - age`, then the ordinary invalidation rules apply, and the target may or not rerun. If you want to force the target to run every 3 days, for example, set `age = as.difftime(3, units = "days").`

- **command**  
  Logical, whether to rerun the target if command changed since last time.

- **depend**  
  Logical, whether to rerun the target if the value of one of the dependencies changed.

- **format**  
  Logical, whether to rerun the target if the user-specified storage format changed. The storage format is user-specified through `tar_target()` or `tar_option_set()`.

- **repository**  
  Logical, whether to rerun the target if the user-specified storage repository changed. The storage repository is user-specified through `tar_target()` or `tar_option_set()`.
iteration Logical, whether to rerun the target if the user-specified iteration method changed. The iteration method is user-specified through `tar_target()` or `tar_option_set()`.

g file Logical, whether to rerun the target if the file(s) with the return value changed or at least one is missing.

Details

tar_cue_age() uses the time stamps from `tar_meta()`$time. If no time stamp is recorded, the cue defaults to the ordinary invalidation rules (i.e. mode = "thorough" in `targets::tar_cue()`).

Value

A cue object. See the "Cue objects" section for background.

Dynamic branches at regular time intervals

Time stamps are not recorded for whole dynamic targets, so `tar_age()` is not a good fit for dynamic branching. To invalidate dynamic branches at regular intervals, it is recommended to use `targets::tar_older()` in combination with `targets::tar_invalidate()` right before calling `tar_make()`. For example, `tar_invalidate(all_of(tar_older(Sys.time - as.difftime(1, units = "weeks"))))` # nolint invalidates all targets more than a week old. Then, the next `tar_make()` will rerun those targets.

Cue objects

A cue object is an object generated by `targets::tar_cue()`, `tarchetypes::tar_cue_force()`, or similar. It is a collection of decision rules that decide when a target is invalidated/outsdated (e.g. when `tar_make()` or similar reruns the target). You can supply these cue objects to the `tar_target()` function or similar. For example, `tar_target(x, run_stuff(), cue = tar_cue(mode = "always"))` is a target that always calls `run_stuff()` during `tar_make()` and always shows as invalidated/outsdated in `tar_outdated()`, `tar_visnetwork()`, and similar functions.

See Also

Other cues: `tar_age()`, `tar_cue_age_raw()`, `tar_cue_force()`, `tar_cue_skip()`

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      library(tarchetypes)
      list(
        targets::tar_target(
          data,
          data.frame(x = seq_len(26)),
          cue = tarchetypes::tar_cue_age(
            name = data,
            age = as.difftime(0.5, units = "secs")
          )
        )
      )
    })
  }
```
`tar_cue_age_raw` acts like `tar_cue_age()` except the name argument is a character string, not a symbol. `tar_cue_age_raw()` creates a cue object to rerun a target if the most recent output data becomes old enough. The age of the target is determined by `targets::tar_timestamp()`, and the way the time stamp is calculated is explained in the Details section of the help file of that function.

**Description**

The function `tar_cue_age_raw()` is used to run a target when the last run reaches a certain age (raw version).

**Usage**

```r
tar_cue_age_raw(
  name,
  age,
  command = TRUE,
  depend = TRUE,
  format = TRUE,
  repository = TRUE,
  iteration = TRUE,
  file = TRUE
)
```

**Arguments**

- **name**: Character of length 1, name of the target.
- **age**: A `difftime` object of length 1, such as `as.difftime(3, units = "days")`. If the target's output data files are older than age (according to the most recent time stamp over all the target's output files) then the target will rerun. On the other hand, if at least one data file is younger than `Sys.time() - age`, then the ordinary invalidation rules apply, and the target may or not rerun. If you want to force the target to run every 3 days, for example, set `age = as.difftime(3, units = "days")`.
- **command**: Logical, whether to rerun the target if command changed since last time.
- **depend**: Logical, whether to rerun the target if the value of one of the dependencies changed.
- **format**: Logical, whether to rerun the target if the user-specified storage format changed. The storage format is user-specified through `tar_target()` or `tar_option_set()`.
repository Logical, whether to rerun the target if the user-specified storage repository changed. The storage repository is user-specified through `tar_target()` or `tar_option_set()`.

iteration Logical, whether to rerun the target if the user-specified iteration method changed. The iteration method is user-specified through `tar_target()` or `tar_option_set()`.

file Logical, whether to rerun the target if the file(s) with the return value changed or at least one is missing.

Details

`tar_cue_age_raw()` uses the time stamps from `tar_meta()$time`. If no time stamp is recorded, the cue defaults to the ordinary invalidation rules (i.e. `mode = "thorough"` in `targets::tar_cue()`).

Value

A cue object. See the "Cue objects" section for background.

Dynamic branches at regular time intervals

Time stamps are not recorded for whole dynamic targets, so `tar_age()` is not a good fit for dynamic branching. To invalidate dynamic branches at regular intervals, it is recommended to use `targets::tar_older()` in combination with `targets::tar_invalidate()` right before calling `tar_make()`. For example, `tar_invalidate(all_of(tar_older(Sys.time - as.difftime(1, units = "weeks"))))` # nolint invalidates all targets more than a week old. Then, the next `tar_make()` will rerun those targets.

Cue objects

A cue object is an object generated by `targets::tar_cue()`, `tarchetypes::tar_cue_force()`, or similar. It is a collection of decision rules that decide when a target is invalidated/outrated (e.g. when `tar_make()` or similar reruns the target). You can supply these cue objects to the `tar_target()` function or similar. For example, `tar_target(x, run_stuff(), cue = tar_cue(mode = "always"))` is a target that always calls `run_stuff()` during `tar_make()` and always shows as invalidated/outrated in `tar_outdated()`, `tar_visnetwork()`, and similar functions.

See Also

Other cues: `tar_age()`, `tar_cue_age()`, `tar_cue_force()`, `tar_cue_skip()`

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      library(tarchetypes)
      list(
        targets::tar_target(
          data,
          data.frame(x = seq_len(26)),
          cue = tarchetypes::tar_cue_age_raw(
            name = "data",
```
Description

tar_cue_force() creates a cue object to force a target to run if an arbitrary condition evaluates to TRUE. Supply the returned cue object to the cue argument of targets::tar_target() or similar.

Usage

tar_cue_force(
  condition,
  command = TRUE,
  depend = TRUE,
  format = TRUE,
  repository = TRUE,
  iteration = TRUE,
  file = TRUE
)

Arguments

condition Logical vector evaluated locally when the target is defined. If any element of condition is TRUE, the target will definitely rerun when the pipeline runs. Otherwise, the target may or may not rerun, depending on the other invalidation rules. condition is evaluated when this cue factory is called, so the condition cannot depend on upstream targets, and it should be quick to calculate.

command Logical, whether to rerun the target if command changed since last time.

depend Logical, whether to rerun the target if the value of one of the dependencies changed.

format Logical, whether to rerun the target if the user-specified storage format changed. The storage format is user-specified through tar_target() or tar_option_set().

repository Logical, whether to rerun the target if the user-specified storage repository changed. The storage repository is user-specified through tar_target() or tar_option_set().

iteration Logical, whether to rerun the target if the user-specified iteration method changed. The iteration method is user-specified through tar_target() or tar_option_set().

```r
age = as.difftime(0.5, units = "secs")
)
)
}
targets::tar_make()
Sys.sleep(0.6)
targets::tar_make()
)
}
```
file
Logical, whether to rerun the target if the file(s) with the return value changed or at least one is missing.

Details

tar_cue_force() and tar_force() operate differently. The former defines a cue object based on an eagerly evaluated condition, and tar_force() puts the condition in a special upstream target that always runs. Unlike tar_cue_force(), the condition in tar_force() can depend on upstream targets, but the drawback is that targets defined with tar_force() will always show up as outdated in functions like tar_outdated() and tar_visnetwork() even though tar_make() may still skip the main target if the condition is not met.

Value

A cue object. See the "Cue objects" section for background.

Cue objects

A cue object is an object generated by targets::tar_cue(), tarchetypes::tar_cue_force(), or similar. It is a collection of decision rules that decide when a target is invalidated/outrated (e.g. when tar_make() or similar reruns the target). You can supply these cue objects to the tar_target() function or similar. For example, tar_target(x, run_stuff(), cue = tar_cue(mode = "always")) is a target that always calls run_stuff() during tar_make() and always shows as invalidated/outrated in tar_outdated(), tar_visnetwork(), and similar functions.

See Also

Other cues: tar_age(), tar_cue_age_raw(), tar_cue_age(), tar_cue_skip()

Examples

if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script(
      library(tarchetypes)
      list(
        targets::tar_target(
          data,
          data.frame(x = seq_len(26)),
          cue = tarchetypes::tar_cue_force(1 > 0)
        )
      )
    )
  })
  targets::tar_make()
  targets::tar_make()
}
**Description**

tar_cue_skip() creates a cue object to skip a target if an arbitrary condition evaluates to `TRUE`. The target still builds if it was never built before. Supply the returned cue object to the cue argument of `targets::tar_target()` or similar.

**Usage**

tar_cue_skip(
  condition,
  command = TRUE,
  depend = TRUE,
  format = TRUE,
  repository = TRUE,
  iteration = TRUE,
  file = TRUE
)

**Arguments**

- **condition**: Logical vector evaluated locally when the target is defined. If any element of `condition` is `TRUE`, the pipeline will skip the target unless the target has never been built before. If all elements of `condition` are `FALSE`, then the target may or may not rerun, depending on the other invalidation rules. `condition` is evaluated when this cue factory is called, so the condition cannot depend on upstream targets, and it should be quick to calculate.

- **command**: Logical, whether to rerun the target if command changed since last time.

- **depend**: Logical, whether to rerun the target if the value of one of the dependencies changed.

- **format**: Logical, whether to rerun the target if the user-specified storage format changed. The storage format is user-specified through `tar_target()` or `tar_option_set()`.

- **repository**: Logical, whether to rerun the target if the user-specified storage repository changed. The storage repository is user-specified through `tar_target()` or `tar_option_set()`.

- **iteration**: Logical, whether to rerun the target if the user-specified iteration method changed. The iteration method is user-specified through `tar_target()` or `tar_option_set()`.

- **file**: Logical, whether to rerun the target if the file(s) with the return value changed or at least one is missing.

**Value**

A cue object. See the "Cue objects" section for background.
Cue objects

        cue = tarchetypes::tar_cue_skip(1 > 0)
      )
    )
  })
  targets::tar_make()
  targets::tar_make()
}
```

---

tar_download

Target that downloads URLs.

Description

Create a target that downloads file from one or more URLs and automatically reruns when the remote data changes (according to the ETags or last-modified time stamps).
Usage

```r
tar_download(
  name,
  urls,
  paths,
  method = NULL,
  quiet = TRUE,
  mode = "w",
  cacheOK = TRUE,
  extra = NULL,
  headers = NULL,
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)
```

Arguments

- **name**: Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target’s initial RNG state.

- **urls**: Character vector of URLs to track and download. Must be known and declared before the pipeline runs.

- **paths**: Character vector of local file paths to download each of the URLs. Must be known and declared before the pipeline runs.

- **method**: Method to be used for downloading files. Current download methods are "internal", "wininet" (Windows only) "libcurl", "wget" and "curl", and there is a value "auto": see ‘Details’ and ‘Note’. The method can also be set through the option "download.file.method": see `options()`.

- **quiet**: If TRUE, suppress status messages (if any), and the progress bar.
character. The mode with which to write the file. Useful values are "w", "wb" (binary), "a" (append) and "ab". Not used for methods "wget" and "curl". See also 'Details', notably about using "wb" for Windows.

logical. Is a server-side cached value acceptable?

character vector of additional command-line arguments for the "wget" and "curl" methods.

named character vector of HTTP headers to use in HTTP requests. It is ignored for non-HTTP URLs. The User-Agent header, coming from the HTTPUserAgent option (see options) is used as the first header, automatically.

Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with vctrs::vec_slice() and aggregation happens with vctrs::vec_c().
- "list", branching happens with [[[]]] and aggregation happens with list().
- "group": dplyr::group_by()-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special tar_group column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the tar_group() function to see how you can create the special tar_group column with dplyr::group_by().

Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

Logical, whether to run base::gc() just before the target runs.

Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.
priority: Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources: Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

storage: Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when `retrieval = "none"`).

If you select `storage = "none"`, then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (`format = "file"`) it is the responsibility of the user to write to `tar_path()` from inside the target. An example target could look something like `tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")`.

The distinguishing feature of `storage = "none"` (as opposed to `format = "file"`) is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, `storage = "none"` is completely unnecessary if `format` is "file".

retrieval: Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue: An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Details

tar_download() creates a pair of targets, one upstream and one downstream. The upstream target uses `format = "url"` (see `targets::tar_target()`) to track files at one or more URLs, and automatically invalidate the target if the ETags or last-modified time stamps change. The downstream target depends on the upstream one, downloads the files, and tracks them using `format = "file"`.

Value

A list of two target objects, one upstream and one downstream. The upstream one watches a URL for changes, and the downstream one downloads it. See the “Target objects” section for background.
Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

See Also

Other targets with custom invalidation rules: tar_change(), tar_force(), tar_skip()

Examples

if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      list(
        tarchetypes::tar_download(
          x,
          urls = c("https://httpbin.org/etag/test", "https://r-project.org"),
          paths = c("downloaded_file_1", "downloaded_file_2")
        )
      )
    })
  targets::tar_make()
  targets::tar_read(x)
})
}

---

**tar_eval**

Evaluate multiple expressions created with symbol substitution.

**Description**

Loop over a grid of values, create an expression object from each one, and then evaluate that expression. Helps with general metaprogramming.

**Usage**

tar_eval(expr, values, envir = parent.frame())
Arguments

**expr**
Starting expression. Values are iteratively substituted in place of symbols in expr to create each new expression, and then each new expression is evaluated.

**values**
List of values to substitute into expr to create the expressions. All elements of values must have the same length.

**envir**
Environment in which to evaluate the new expressions.

Value

A list of return values from the generated expression objects. Often, these values are target objects. See the "Target objects" section for background on target objects specifically.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

See Also

Other Metaprogramming utilities: `tar_eval_raw()`, `tar_sub_raw()`, `tar_sub()`

Examples

```r
# tar_map() is incompatible with tar_render() because the latter
# operates on preexisting tar_target() objects. By contrast,
# tar_eval() and tar_sub() iterate over the literal code
# farther upstream.
values <- list(
  name = lapply(c("name1", "name2"), as.symbol),
  file = list("file1.Rmd", "file2.Rmd")
)
tar_sub(list(name, file), values = values)
tar_sub(tar_render(name, file), values = values)
path <- tempfile()
file.create(path)
str(tar_eval(tar_render(name, path), values = values))
# So in your _targets.R file, you can define a pipeline like as below.
# Just make sure to set a unique name for each target
# (which tar_map() does automatically).
values <- list(
  name = lapply(c("name1", "name2"), as.symbol),
  file = c(path, path)
)
```

list(
    tar_eval(tar_render(name, file), values = values)
)

tar_eval_raw

Evaluate multiple expressions created with symbol substitution (raw version).

Description

Loop over a grid of values, create an expression object from each one, and then evaluate that expression. Helps with general metaprogramming. Unlike `tar_sub()`, which quotes the `expr` argument, `tar_sub_raw()` assumes `expr` is an expression object.

Usage

tar_eval_raw(expr, values, envir = parent.frame())

Arguments

- **expr**: Expression object with the starting expression. Values are iteratively substituted in place of symbols in `expr` to create each new expression, and then each expression is evaluated.
- **values**: List of values to substitute into `expr` to create the expressions. All elements of `values` must have the same length.
- **envir**: Environment in which to evaluate the new expressions.

Value

A list of return values from evaluating the expression objects. Often, these values are target objects. See the "Target objects" section for background on target objects specifically.

Target objects

Most `tarchetypes` functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

  file = c(path, path)
)
list(
  tar_eval_raw(quote(tar_render(name, file)), values = values)
)

---

tar_files

Dynamic branching over output or input files.

Description

Dynamic branching over output or input files.

Usage

tar_files(
  name,
  command,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = c("file", "url", "aws_file"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
)
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and `run set.seed()` on the result to locally recreate the target’s initial RNG state.

command R code to run the target.

tidy_eval Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator `!!` to programatically insert the values of global objects.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Character of length 1. Must be "file", "url", or "aws_file". See the format argument of `targets::tar_target()` for details.

repository Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with `vctrs::vec_slice()` and aggregation happens with `vctrs::vec_c()`.
• "list", branching happens with \[
\] and aggregation happens with \\texttt{list()}.  
• "group": \texttt{dplyr::group_by()-like} functionality to branch over subsets of  
a data frame. The target’s return value must be a data frame with a special  
\texttt{tar_group} column of consecutive integers from 1 through the number  
of groups. Each integer designates a group, and a branch is created for each  
collection of rows in a group. See the \texttt{tar_group()} function to see how  
you can create the special \texttt{tar_group} column with \texttt{dplyr::group_by()}.  

\textbf{error} Character of length 1, what to do if the target stops and throws an error. Options:  
• "stop": the whole pipeline stops and throws an error.  
• "continue": the whole pipeline keeps going.  
• "abridge": any currently running targets keep running, but no new tar- 
ggets launch after that. (Visit \url{https://books.ropensci.org/targets/  
debugging.html} to learn how to debug targets using saved workspaces.)  
• "null": The errored target continues and returns \NULL. The data hash  
deliberately wrong so the target is not up to date for the next run of the  
pipeline.  

\textbf{memory} Character of length 1, memory strategy. If "persistent", the target stays in  
memory until the end of the pipeline (unless storage is "worker", in which case  
targets unloads the value from memory right after storing it in order to avoid  
sending copious data over a network). If "transient", the target gets unloaded  
after every new target completes. Either way, the target gets automatically  
loaded into memory whenever another target needs the value. For cloud-based  
dynamic files (e.g. format = "file" with repository = "aws"), this memory  
strategy applies to the temporary local copy of the file: "persistent" means  
it remains until the end of the pipeline and is then deleted, and "transient"  
means it gets deleted as soon as possible. The former conserves bandwidth, and  
the latter conserves local storage.  

\textbf{garbage_collection}  
Logical, whether to run \texttt{base::gc()} just before the target runs.  

\textbf{deployment} Character of length 1, only relevant to \texttt{tar_make_clustermq()} and \texttt{tar_make_future()}.  
If "worker", the target builds on a parallel worker. If "main", the target builds  
on the host machine / process managing the pipeline.  

\textbf{priority} Numeric of length 1 between 0 and 1. Controls which targets get deployed  
first when multiple competing targets are ready simultaneously. Targets with  
priorities closer to 1 get built earlier (and polled earlier in \texttt{tar_make_future()}).  

\textbf{resources} Object returned by \texttt{tar_resources()} with optional settings for high-performance  
computing functionality, alternative data storage formats, and other optional ca- 
pabilities of targets. See \texttt{tar_resources()} for details.  

\textbf{storage} Character of length 1, only relevant to \texttt{tar_make_clustermq()} and \texttt{tar_make_future()}.  
Must be one of the following values:  
• "main": the target’s return value is sent back to the host machine and  
saved/uploaded locally.  
• "worker": the worker saves/uploads the value.  
• "none": almost never recommended. It is only for niche situations, e.g. the  
data needs to be loaded explicitly from another language. If you do use it,
then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to \texttt{tar.path()} from inside the target. An example target could look something like \texttt{tar_target(x, saveRDS("value", tar.path(create_dir = TRUE)); "ignored", storage = "none")}. The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

\textbf{retrieval} Character of length 1, only relevant to \texttt{tar_make_clustermq()} and \texttt{tar_make_future()}. Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

\textbf{cue} An optional object from \texttt{tar_cue()} to customize the rules that decide whether the target is up to date. Only applies to the downstream target. The upstream target always runs.

**Details**

tar.files() creates a pair of targets, one upstream and one downstream. The upstream target does some work and returns some file paths, and the downstream target is a pattern that applies format = "file" or format = "url". (URLs are input-only, they must already exist beforehand.) This is the correct way to dynamically iterate over file/url targets. It makes sure any downstream patterns only rerun some of their branches if the files/urls change. For more information, visit https://github.com/ropensci/targets/issues/136 and https://github.com/ropensci/drake/issues/1302.

**Value**

A list of two targets, one upstream and one downstream. The upstream one does some work and returns some file paths, and the downstream target is a pattern that applies format = "file" or format = "url". See the "Target objects" section for background.

**Target objects**

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.
For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

### See Also

Other Dynamic branching over files: `tar_files_input_raw()`, `tar_files_input()`, `tar_files_raw()`

### Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({
    # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      # Do not use temp files in real projects
      # or else your targets will always rerun.
      paths <- unlist(replicate(2, tempfile()))
      file.create(paths)
      list(
        tarchetypes::tar_files(x, paths)
      )
    })
  })
  targets::tar_make()
  targets::tar_read(x)
}
```

---

**Description**

Dynamic branching over input files or URLs.

**Usage**

```r
tar_files_input(
  name,
  files,
  batches = length(files),
  format = c("file", "url", "aws_file"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  cue = targets::tar_option_get("cue")
)
```
Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target’s initial RNG state.

files Nonempty character vector of known existing input files to track for changes.

batches Positive integer of length 1, number of batches to partition the files. The default is one file per batch (maximum number of batches) which is simplest to handle but could cause a lot of overhead and consume a lot of computing resources. Consider reducing the number of batches below the number of files for heavy workloads.

format Character, either "file" or "url". See the format argument of `targets::tar_target()` for details.

repository Character of length 1, remote repository for target storage. Choices:
- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration Character, iteration method. Must be a method supported by the iteration argument of `targets::tar_target()`. The iteration method for the upstream target is always "list" in order to support batching.

error Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.
memory
Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection
Logical, whether to run base::gc() just before the target runs.
priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).
resources
Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.
cue
An optional object from tar_cue() to customize the rules that decide whether the target is up to date. Only applies to the downstream target. The upstream target always runs.

Details
tar_files_input() is like tar_files() but more convenient when the files in question already exist and are known in advance. Whereas tar_files() always appears outdated (e.g. with tar_outdated()) because it always needs to check which files it needs to branch over, tar_files_input() will appear up to date if the files have not changed since last tar_make(). In addition, tar_files_input() automatically groups input files into batches to reduce overhead and increase the efficiency of parallel processing.
tar_files_input() creates a pair of targets, one upstream and one downstream. The upstream target does some work and returns some file paths, and the downstream target is a pattern that applies format = "file" or format = "url". This is the correct way to dynamically iterate over file/url targets. It makes sure any downstream patterns only rerun some of their branches if the files/urls change. For more information, visit https://github.com/ropensci/targets/issues/136 and https://github.com/ropensci/drake/issues/1302.

Value
A list of two targets, one upstream and one downstream. The upstream one does some work and returns some file paths, and the downstream target is a pattern that applies format = "file" or format = "url". See the "Target objects" section for background.

Target objects
Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described
at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Other Dynamic branching over files: tar_files_input_raw(), tar_files_raw(), tar_files()

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
    targets::tar_dir({ # tar_dir() runs code from a temporary directory.
        targets::tar_script({
            # Do not use temp files in real projects
            # or else your targets will always rerun.
            paths <- unlist(replicate(4, tempfile()))
            file.create(paths)
            list(
                tarchetypes::tar_files_input(
                    x,
                    paths,
                    batches = 2
                )
            )
        })
    targets::tar_make()
    targets::tar_read(x)
    targets::tar_read(x, branches = 1)
})
}
```

---

**tar_files_input_raw**  
*Dynamic branching over input files or URLs (raw version).*

Description

Dynamic branching over input files or URLs.

Usage

```r
tar_files_input_raw(
    name,
    files,  # optional
    batches = length(files),
    format = c("file", "url", "aws_file"),
```
repository = targets::tar_option_get("repository"),
iteration = targets::tar_option_get("iteration"),
error = targets::tar_option_get("error"),
memory = targets::tar_option_get("memory"),
garbage_collection = targets::tar_option_get("garbage_collection"),
priority = targets::tar_option_get("priority"),
resources = targets::tar_option_get("resources"),
cue = targets::tar_option_get("cue")
)

Arguments

name  Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target’s initial RNG state.

files  Nonempty character vector of known existing input files to track for changes.

batches  Positive integer of length 1, number of batches to partition the files. The default is one file per batch (maximum number of batches) which is simplest to handle but could cause a lot of overhead and consume a lot of computing resources. Consider reducing the number of batches below the number of files for heavy workloads.

format  Character, either "file" or "url". See the format argument of `targets::tar_target()` for details.

repository  Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.
tar_files_input_raw

iteration Character, iteration method. Must be a method supported by the iteration argument of targets::tar_target(). The iteration method for the upstream target is always "list" in order to support batching.

error Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

cue An optional object from tar_cue() to customize the rules that decide whether the target is up to date. Only applies to the downstream target. The upstream target always runs.

Details

tar_files_input_raw() is similar to tar_files_input() except the name argument must be a character string.

tar_files_input_raw() creates a pair of targets, one upstream and one downstream. The upstream target does some work and returns some file paths, and the downstream target is a pattern that applies format = "file" or format = "url". This is the correct way to dynamically iterate over file/url targets. It makes sure any downstream patterns only rerun some of their branches if the files/urls change. For more information, visit https://github.com/ropensci/targets/issues/136 and https://github.com/ropensci/drake/issues/1302.
Value

A list of two targets, one upstream and one downstream. The upstream one does some work and returns some file paths, and the downstream target is a pattern that applies format = "file" or format = "url". See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

        tarchetypes::tar_files_input_raw("x",
          paths,
          batches = 2
        )
      )
    })
  })
  targets::tar_make()
  targets::tar_read(x)
  targets::tar_read(x, branches = 1)
}
```
Dynamic branching over output or input files (raw version).

Description

Dynamic branching over output or input files.

Usage

tar_files_raw(
  name,
  command,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = c("file", "url", "aws_file"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)

Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target's initial RNG state.

command R code to run the target.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.
format  Character of length 1. Must be "file", "url", or "aws_file". See the format argument of targets::tar_target() for details.

repository  Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration  Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with vctrs::vec_slice() and aggregation happens with vctrs::vec_c().
- "list", branching happens with [[[]]] and aggregation happens with list().
- "group": dplyr::group_by()-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with dplyr::group_by().

error  Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory  Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. `format = "file"` with `repository = "aws"`), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.
garbage_collection
Logical, whether to run base::gc() just before the target runs.

deployment
Character of length 1, only relevant to `tar_make_cluster mq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources
Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

storage
Character of length 1, only relevant to `tar_make_cluster mq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when `retrieval = "none"`).

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to `tar_path()` from inside the target. An example target could look something like `tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")`. The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval
Character of length 1, only relevant to `tar_make_cluster mq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue
An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date. Only applies to the downstream target. The upstream target always runs.

Details

`tar_files_raw()` is similar to `tar_files()` except the name argument must be a character string and command must be a language object.
tar_files_raw() creates a pair of targets, one upstream and one downstream. The upstream target does some work and returns some file paths, and the downstream target is a pattern that applies `format = "file"` or `format = "url"`. (URLs are input-only, they must already exist beforehand.) This is the correct way to dynamically iterate over file/url targets. It makes sure any downstream patterns only rerun some of their branches if the files/urls change. For more information, visit https://github.com/ropensci/targets/issues/136 and https://github.com/ropensci/drake/issues/1302.

Value

A list of two targets, one upstream and one downstream. The upstream one does some work and returns some file paths, and the downstream target is a pattern that applies `format = "file"` or `format = "url"`. See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

See Also

Other Dynamic branching over files: `tar_files_input_raw()`, `tar_files_input()`, `tar_files()`

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      # Do not use temp files in real projects
      # or else your targets will always rerun.
      paths <- unlist(replicate(2, tempfile()))
      file.create(paths)
      command <- as.call(list("c", paths))
      list(
        tarchetypes::tar_files_raw("x", command)
      )
    })
  }
  targets::tar_make()
  targets::tar_read(x)
}
```
Description

Create a pair of targets: one to track a file with format = "file", and another to read the file.

Usage

tar_file_read(
  name,
  command,
  read,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)

Arguments

name  Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

command  R code that runs in the format = "file" target and returns the file to be tracked.

read  R code to read the file. Must include !!.x where the file path goes: for example, read = readr::read_csv(file = !!.x, col_types = readr::cols()).
tidy_eval Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Optional storage format for the target’s return value. With the exception of format = "file", each target gets a file in _targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

error Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.
garbage_collection
   Logical, whether to run base::gc() just before the target runs.

deployment
   Character of length 1, only relevant to tar_make_clustermq() and tar_make_future().
   If "worker", the target builds on a parallel worker. If "main", the target builds
   on the host machine / process managing the pipeline.

priority
   Numeric of length 1 between 0 and 1. Controls which targets get deployed
   first when multiple competing targets are ready simultaneously. Targets with
   priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources
   Object returned by tar_resources() with optional settings for high-performance
   computing functionality, alternative data storage formats, and other optional ca-
   pabilities of targets. See tar_resources() for details.

storage
   Character of length 1, only relevant to tar_make_clustermq() and tar_make_future().
   Must be one of the following values:
   • "main": the target’s return value is sent back to the host machine and
     saved/uploaded locally.
   • "worker": the worker saves/uploads the value.
   • "none": almost never recommended. It is only for niche situations, e.g. the
     data needs to be loaded explicitly from another language. If you do use it,
     then the return value of the target is totally ignored when the target ends,
     but each downstream target still attempts to load the data file (except when
     retrieval = "none").
     If you select storage = "none", then the return value of the target’s com-
     mand is ignored, and the data is not saved automatically. As with dy-
     namic files (format = "file") it is the responsibility of the user to write to
     tar_path() from inside the target. An example target could look some-
     thing like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE));
     "ignored", storage = "none").
     The distinguishing feature of storage = "none" (as opposed to format =
     "file") is that in the general case, downstream targets will automatically
     try to load the data from the data store as a dependency. As a corollary,
     storage = "none" is completely unnecessary if format is "file".

retrieval
   Character of length 1, only relevant to tar_make_clustermq() and tar_make_future().
   Must be one of the following values:
   • "main": the target’s dependencies are loaded on the host machine and sent
     to the worker before the target builds.
   • "worker": the worker loads the targets dependencies.
   • "none": the dependencies are not loaded at all. This choice is almost never
     recommended. It is only for niche situations, e.g. the data needs to be
     loaded explicitly from another language.

cue
   An optional object from tar_cue() to customize the rules that decide whether
   the target is up to date.

Value

A list of two new target objects to track a file and read the contents. See the “Target objects” section
for background.
**Target objects**

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script(
      tar_file_read(data, get_path(), read_csv(file = !!.x, col_types = cols()))
    )
    targets::tar_manifest()
  })
}
```

---

**tar_force**

*Target with a custom condition to force execution.*

**Description**

Create a target that always runs if a user-defined condition rule is met.

**Usage**

```r
tar_force(
  name,
  command,
  force,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
)```
storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)

**Arguments**

- **name**
  Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

- **command**
  R code to run the target.

- **force**
  R code for the condition that forces a build. If it evaluates to TRUE, then your work will run during tar_make().

- **tidy_eval**
  Whether to invoke tidy evaluation (e.g. the !! operator from rlang) as soon as the target is defined (before tar_make()). Applies to arguments command and force.

- **packages**
  Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

- **library**
  Character vector of library paths to try when loading packages.

- **format**
  Optional storage format for the target’s return value. With the exception of format = "file", each target gets a file in _targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

- **repository**
  Character of length 1, remote repository for target storage. Choices:
  - "local": file system of the local machine.
  - "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
  - "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.
iteration Character of length 1, name of the iteration mode of the target. Choices:
- "vector": branching happens with `vctrs::vec_slice()` and aggregation happens with `vctrs::vec_c()`.
- "list": branching happens with `[[ ]]` and aggregation happens with `list()`.
- "group": `dplyr::group_by()`-like functionality to branch over subsets of a data frame. The target's return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with `dplyr::group_by()`.

error Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns `NULL`. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. `format = "file"` with `repository = "aws"`), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run `base::gc()` just before the target runs.

deployment Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

storage Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target's return value is sent back to the host machine and saved/uploaded locally.
• "worker": the worker saves/uploads the value.
• "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to \texttt{tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")'.'

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

\textbf{retrieval} Character of length 1, only relevant to \texttt{tar_make_clustermq()} and \texttt{tar_make_future()}. Must be one of the following values:

  • "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
  • "worker": the worker loads the targets dependencies.
  • "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

\textbf{cue} An optional object from \texttt{tar_cue()} to customize the rules that decide whether the target is up to date. Only applies to the downstream target. The upstream target always runs.

\textbf{Details}

\texttt{tar_force()} creates a target that always runs when a custom condition is met. The implementation builds on top of \texttt{tar_change()}. Thus, a pair of targets is created: an upstream auxiliary target to indicate the custom condition and a downstream target that responds to it and does your work.

\texttt{tar_force()} does not actually use \texttt{tar_cue_force()}, and the mechanism is totally different. Because the upstream target always runs, \texttt{tar_outdated()} and \texttt{tar_visnetwork()} will always show both targets as outdated. However, \texttt{tar_make()} will still skip the downstream one if the upstream custom condition is not met.

\textbf{Value}

A list of 2 targets objects: one to indicate whether the custom condition is met, and another to respond to it and do your actual work. See the "Target objects" section for background.

\textbf{Target objects}

Most \texttt{tarchetypes} functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described...
at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      list(
        tarchetypes::tar_force(x, tempfile(), force = 1 > 0)
      )
    })
    targets::tar_make()
    targets::tar_make()
  })
}
```

---

**tar_formats**

**Target formats**

**Description**

Target archetypes for specialized storage formats.

**Usage**

```r
tar_url(
  name,
  command,
  pattern = NULL,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
)```
priority = targets::tar_option_get("priority"),
resources = targets::tar_option_get("resources"),
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

tar_file(
  name,
  command,
  pattern = NULL,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),

Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

command R code to run the target.

pattern Language to define branching for a target. For example, in a pipeline with numeric vector targets x and y, tar_target(z, x + y, pattern = map(x, y)) implicitly defines branches of z that each compute x[1] + y[1], x[2] + y[2], and so on. See the user manual for details.

tidy_eval Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.
library
Character vector of library paths to try when loading packages.

repository
Character of length 1, remote repository for target storage. Choices:
- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration
Character of length 1, name of the iteration mode of the target. Choices:
- "vector": branching happens with vctrs::vec_slice() and aggregation happens with vctrs::vec_c().
- "list", branching happens with [[]] and aggregation happens with list().
- "group": dplyr::group_by()-like functionality to branch over subsets of a data frame. The target's return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with dplyr::group_by().

error
Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory
Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.
garbage_collection
Logical, whether to run base::gc() just before the target runs.

deployment
Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources
Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

storage
Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to `tar_path()` from inside the target. An example target could look something like `tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")`.

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval
Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue
An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Details
These functions are shorthand for targets with specialized storage formats. For example, `tar_qs(name, fun())` is equivalent to `tar_target(name, fun(), format = "qs")`. For details on specialized
storage formats, open the help file of the `targets::tar_target()` function and read about the format argument.

**Value**

A `tar_target()` object with the eponymous storage format. See the "Target objects" section for background.

**Target objects**

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script(
      list(
        tarchetypes::tar_rds(x, 1)
      )
    )
  )
  targets::tar_make()
}
```

---

**tar_group_by**

*Group a data frame target by one or more variables.*

**Description**

Create a target that outputs a grouped data frame with `dplyr::group_by()` and `targets::tar_group()`. Downstream dynamic branching targets will iterate over the groups of rows.

**Usage**

```r
tar_group_by(
  name,
  command,
  ..., 
  tidy_eval = targets::tar_option_get("tidy_eval"),
```
packages = targets::tar_option_get("packages"),
library = targets::tar_option_get("library"),
format = targets::tar_option_get("format"),
repository = targets::tar_option_get("repository"),
error = targets::tar_option_get("error"),
memory = targets::tar_option_get("memory"),
garbage_collection = targets::tar_option_get("garbage_collection"),
deployment = targets::tar_option_get("deployment"),
priority = targets::tar_option_get("priority"),
resources = targets::tar_option_get("resources"),
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

command R code to run the target.

... Symbols, variables in the output data frame to group by.

tidy_eval Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Optional storage format for the target’s return value. With the exception of format = "file", each target gets a file in _targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository Character of length 1, remote repository for target storage. Choices:
  • "local": file system of the local machine.
  • "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws().
but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

error Character of length 1, what to do if the target stops and throws an error. Options:
  - "stop": the whole pipeline stops and throws an error.
  - "continue": the whole pipeline keeps going.
  - "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
  - "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
  - "main": the target's return value is sent back to the host machine and saved/uploaded locally.
• "worker": the worker saves/uploads the value.
• "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target's command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to `tar_path()` from inside the target. An example target could look something like `tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")`.

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

**retrieval**
Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
• "main": the target's dependencies are loaded on the host machine and sent to the worker before the target builds.
• "worker": the worker loads the targets dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

**cue**
An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

**Value**
A target object to generate a grouped data frame to allows downstream dynamic targets to branch over the groups of rows. See the "Target objects" section for background.

**Target objects**
Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**See Also**
Other Grouped data frame targets: `tar_group_count()`, `tar_group_select()`, `tar_group_size()`
Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      produce_data <- function() {
        expand.grid(var1 = c("a", "b"), var2 = c("c", "d"), rep = c(1, 2, 3))
      }
      list(
        tarchetypes::tar_group_by(data, produce_data(), var1, var2),
        tar_target(group, data, pattern = map(data))
      )
    )
  })
  targets::tar_make()
  # Read the first row group:
  targets::tar_read(group, branches = 1)
  # Read the second row group:
  targets::tar_read(group, branches = 2)
}
```

**tar_group_count**

Group the rows of a data frame into a given number groups

**Description**

Create a target that outputs a grouped data frame for downstream dynamic branching. Set the maximum number of groups using `count`. The number of rows per group varies but is approximately uniform.

**Usage**

```r
tar_group_count(
  name,
  command,
  count,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
)```
```r
cue = targets::tar_option_get("cue")
```

## Arguments

**name**
Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and `run set.seed()` on the result to locally recreate the target's initial RNG state.

**command**
R code to run the target.

**count**
Positive integer, maximum number of row groups

**tidy_eval**
Logical, whether to enable tidy evaluation when interpreting `command` and `pattern`. If `TRUE`, you can use the "bang-bang" operator `!!` to programmatically insert the values of global objects.

**packages**
Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

**library**
Character vector of library paths to try when loading packages.

**format**
Optional storage format for the target's return value. With the exception of `format = "file"`, each target gets a file in `_targets/objects`, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

**repository**
Character of length 1, remote repository for target storage. Choices:
- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for instructions.

Note: if `repository` is not "local" and `format` is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

**error**
Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
• "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
• "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1, only relevant to tar_make_cluster() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage Character of length 1, only relevant to tar_make_cluster() and tar_make_future(). Must be one of the following values:
• "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
• "worker": the worker saves/uploads the value.
• "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").
If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")'.
The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

The retrieval character of length 1, only relevant to `tar_make_cluster_q()` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

The cue is an optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

**Value**

A target object to generate a grouped data frame to allows downstream dynamic targets to branch over the groups of rows. See the "Target objects" section for background.

**Target objects**

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

**See Also**

Other Grouped data frame targets: `tar_group_by()`, `tar_group_select()`, `tar_group_size()`

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      produce_data <- function() {
        expand.grid(var1 = c("a", "b"), var2 = c("c", "d"), rep = c(1, 2, 3))
      }
    })
    list(
      tarchetypes::tar_group_count(data, produce_data(), count = 2),
      tar_target(group, data, pattern = map(data))
    )
  } }
```
tar_group_select

```r
targets::tar_make()
# Read the first row group:
targets::tar_read(group, branches = 1)
# Read the second row group:
targets::tar_read(group, branches = 2)
```

## Description

Group a data frame target with tidyselect semantics.

Create a target that outputs a grouped data frame with `dplyr::group_by()` and `targets::tar_group()`. Unlike `tar_group_by()`, `tar_group_select()` expects you to select grouping variables using tidyselect semantics. Downstream dynamic branching targets will iterate over the groups of rows.

## Usage

```r
tar_group_select(
  name,
  command,
  by = NULL,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)
```

## Arguments

- `name` Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target's name determines its random number generator seed. In this way, each target runs with
a reproducible seed so someone else running the same pipeline should get the
same results, and no two targets in the same pipeline share the same seed. (Even
dynamic branches have different names and thus different seeds.) You can re-
cover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target’s initial RNG state.

**command**
R code to run the target.

**by**
Tidyselect semantics to specify variables to group over. Alternatively, you can
supply a character vector.

**tidy_eval**
Logical, whether to enable tidy evaluation when interpreting `command` and `pattern`. If TRUE, you can use the "bang-bang" operator `!!` to programmatically insert the values of global objects.

**packages**
Character vector of packages to load right before the target builds or the output
data is reloaded for downstream targets. Use `tar_option_set()` to set pack-
ages globally for all subsequent targets you define.

**library**
Character vector of library paths to try when loading packages.

**format**
Optional storage format for the target’s return value. With the exception of
format = "file", each target gets a file in `_targets/objects`, and each format
is a different way to save and load this file. See the "Storage formats" section
for a detailed list of possible data storage formats.

**repository**
Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a
  non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`,
  but versioning capabilities may be lost in doing so. See the cloud stor-
  age section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for
details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage sec-
  tion of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for
instructions.

Note: if `repository` is not "local" and `format` is "file" then the target
should create a single output file. That output file is uploaded to the cloud and
tracked for changes where it exists in the cloud. The local file is deleted after
the target runs.

**error**
Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new tar-
  gets launch after that. (Visit [https://books.ropensci.org/targets/
  debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is
deliberately wrong so the target is not up to date for the next run of the
pipeline.

**memory**
Character of length 1, memory strategy. If "persistent", the target stays in
memory until the end of the pipeline (unless storage is "worker", in which case
targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection
Logical, whether to run base::gc() just before the target runs.

deployment
Character of length 1, only relevant to tar_make_clusterq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources
Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage
Character of length 1, only relevant to tar_make_clusterq() and tar_make_future(). Must be one of the following values:

  • "main": the target's return value is sent back to the host machine and saved/uploaded locally.
  • "worker": the worker saves/uploads the value.
  • "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target's command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval
Character of length 1, only relevant to tar_make_clusterq() and tar_make_future(). Must be one of the following values:

  • "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
  • "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Value

A target object to generate a grouped data frame to allows downstream dynamic targets to branch over the groups of rows. See the "Target objects" section for background.

Target objects

Most `tarchetypes` functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

See Also

Other Grouped data frame targets: `tar_group_by()`, `tar_group_count()`, `tar_group_size()`

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({  # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      produce_data <- function() {
        expand.grid(var1 = c("a", "b"), var2 = c("c", "d"), rep = c(1, 2, 3))
      }
    })
    list(
      tarchetypes::tar_group_select(data, produce_data(), starts_with("var")),
      tar_target(group, data, pattern = map(data))
    )
  })
  targets::tar_make()
  # Read the first row group:
  targets::tar_read(group, branches = 1)
  # Read the second row group:
  targets::tar_read(group, branches = 2)
}
```

**tar_group_size**

Group the rows of a data frame into groups of a given size.

**Description**

Create a target that outputs a grouped data frame for downstream dynamic branching. Row groups have the number of rows you supply to `size` (plus the remainder in a group of its own, if applicable.) The total number of groups varies.

**Usage**

```r
tar_group_size(
  name,
  command,
  size,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)
```

**Arguments**

- **name**: Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target's initial RNG state.

- **command**: R code to run the target.

- **size**: Positive integer, maximum number of rows in each group.
tidy_eval Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Optional storage format for the target’s return value. With the exception of format = "file", each target gets a file in _targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository Character of length 1, remote repository for target storage. Choices:
- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

error Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.
garbage_collection
Logical, whether to run base::gc() just before the target runs.

deployment
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources
Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none").

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue
An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

Value
A target object to generate a grouped data frame to allow downstream dynamic targets to branch over the groups of rows. See the "Target objects" section for background.
Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

    targets::tar_script({
      produce_data <- function() {
        expand.grid(var1 = c("a", "b"), var2 = c("c", "d"), rep = c(1, 2, 3))
      }
    })
  tarchetypes::tar_group_size(data, produce_data(), size = 7),
  tar_target(group, data, pattern = map(data))
  })
  targets::tar_make()
  # Read the first row group:
  targets::tar_read(group, branches = 1)
  # Read the second row group:
  targets::tar_read(group, branches = 2)
}
}
```

---

**tar_hook_before**

*Hook to prepend code*

**Description**

Prepend R code to the commands of multiple targets.

**Usage**

```r
tar_hook_before(targets, hook, names = NULL)
```
Arguments

- **targets**: A list of target objects. The input target list can be arbitrarily nested, but it must consist entirely of target objects. In addition, the return value is a simple list where each element is a target object. All hook functions remove the nested structure of the input target list.

- **hook**: R code to insert. When you supply code to this argument, the code is quoted (not evaluated) so there is no need to wrap it in `quote()`, `expression()`, or similar.

- **names**: Name of targets in the target list to apply the hook. You can supply symbols, a character vector, or tidyselect helpers like `starts_with()`. Targets not included in `names` still remain in the target list, but they are not modified because the hook does not apply to them.

Value

A flattened list of target objects with the hooks applied. Even if the input target list had a nested structure, the return value is a simple list where each element is a target object. All hook functions remove the nested structure of the input target list.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

    targets::tar_script({
      targets <- list(
        # Nested target lists work with hooks.
        list(
          targets::tar_target(x1, task1()),
          targets::tar_target(x2, task2(x1))
        ),
        targets::tar_target(x3, task3(x2)),
        targets::tar_target(y1, task4(x3))
      )
    )
    tarchetypes::tar_hook_before(
```
tar_hook_inner

Hook to wrap dependencies

Description

In the command of each target, wrap each mention of each dependency target in an arbitrary R expression.

Usage

tar_hook_inner(targets, hook, names = NULL, names_wrap = NULL)

Arguments

targets A list of target objects. The input target list can be arbitrarily nested, but it must consist entirely of target objects. In addition, the return value is a simple list where each element is a target object. All hook functions remove the nested structure of the input target list.

hook R code to wrap each target’s command. The hook must contain the special placeholder symbol .x so tar_hook_inner() knows where to insert the code to wrap mentions of dependencies. The hook code is quoted (not evaluated) so there is no need to wrap it in quote(), expression(), or similar.

names Name of targets in the target list to apply the hook. You can supply symbols, a character vector, or tidyselect helpers like starts_with(). Targets not included in names still remain in the target list, but they are not modified because the hook does not apply to them.

names_wrap Names of targets to wrap with the hook where they appear as dependencies in the commands of other targets. You can supply symbols, a character vector, or tidyselect helpers like starts_with().

Details

The expression you supply to hook must contain the special placeholder symbol .x so tar_hook_inner() knows where to insert the original command of the target.

Value

A flattened list of target objects with the hooks applied. Even if the input target list had a nested structure, the return value is a simple list where each element is a target object. All hook functions remove the nested structure of the input target list.
Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects.     targets::tar_script({
      targets <- list(
        # Nested target lists work with hooks.
        list(
          targets::tar_target(x1, task1()),
          targets::tar_target(x2, task2(x1))
        ),
        targets::tar_target(x3, task3(x2, x1)),
        targets::tar_target(y1, task4(x3))
      )
    })
    tarchetypes::tar_hook_inner(
      targets = targets,
      hook = fun(.x),
      names = starts_with("x")
    )
  })
  targets::tar_manifest(fields = command)
}
```

---

tar_hook_outer    Hook to wrap commands

Description

Wrap the command of each target in an arbitrary R expression.

Usage

tar_hook_outer(targets, hook, names = NULL)
Arguments

targets  A list of target objects. The input target list can be arbitrarily nested, but it must consist entirely of target objects. In addition, the return value is a simple list where each element is a target object. All hook functions remove the nested structure of the input target list.

hook  R code to wrap each target’s command. The hook must contain the special placeholder symbol `.x` so `tar_hook_outer()` knows where to insert the original command of the target. The hook code is quoted (not evaluated) so there is no need to wrap it in `quote()`, `expression()`, or similar.

names  Name of targets in the target list to apply the hook. You can supply symbols, a character vector, or tidyselect helpers like `starts_with()`. Targets not included in `names` still remain in the target list, but they are not modified because the hook does not apply to them.

Details

The expression you supply to `hook` must contain the special placeholder symbol `.x` so `tar_hook_outer()` knows where to insert the original command of the target.

Value

A flattened list of target objects with the hooks applied. Even if the input target list had a nested structure, the return value is a simple list where each element is a target object. All hook functions remove the nested structure of the input target list.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/).     targets::tar_script({
      targets <- list(
        # Nested target lists work with hooks.
        list(
          
```
```r
targets::tar_target(x1, task1()),
targets::tar_target(x2, task2(x1))
),
targets::tar_target(x3, task3(x2)),
targets::tar_target(y1, task4(x3))
)
tarchetypes::tar_hook_outer(
    targets = targets,
    hook = postprocess(.x, arg = "value"),
    names = starts_with("x")
)
)}
targets::tar_manifest(fields = command)
)
)

---

tar_knit  

Target with a knitr document.

Description

Shorthand to include knitr document in a targets pipeline.

Usage
tar_knit(
    name,
    path,
    tidy_eval = targets::tar_option_get("tidy_eval"),
    packages = targets::tar_option_get("packages"),
    library = targets::tar_option_get("library"),
    error = targets::tar_option_get("error"),
    memory = targets::tar_option_get("memory"),
    garbage_collection = targets::tar_option_get("garbage_collection"),
    deployment = "main",
    priority = targets::tar_option_get("priority"),
    resources = targets::tar_option_get("resources"),
    retrieval = targets::tar_option_get("retrieval"),
    cue = targets::tar_option_get("cue"),
    quiet = TRUE,
    ...
)

Arguments

name  
Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target,
f(upstream_target()) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

path
Character string, file path to the knitr source file. Must have length 1.

tidy_eval
Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the “bang-bang” operator !! to programmatically insert the values of global objects.

packages
Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library
Character vector of library paths to try when loading packages.

error
Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory
Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection
Logical, whether to run base::gc() just before the target runs.

deployment
Character of length 1, only relevant to tar_make_cluster() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).
resources Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

retrieval Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

quiet Boolean; suppress the progress bar and messages?

... Named arguments to `knitr::knit()`. These arguments are evaluated when the target actually runs in `tar_make()`, not when the target is defined.

Details

`tar_knit()` is an alternative to `tar_target()` for knitr reports that depend on other targets. The knitr source should mention dependency targets with `tar_load()` and `tar_read()` in the active code chunks (which also allows you to knit the report outside the pipeline if the `targets` data store already exists). (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) Then, `tar_knit()` defines a special kind of target. It 1. Finds all the `tar_load()`/`tar_read()` dependencies in the report and inserts them into the target’s command. This enforces the proper dependency relationships. (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) 2. Sets `format = "file"` (see `tar_target()`) so targets watches the files at the returned paths and reruns the report if those files change. 3. Configures the target’s command to return both the output report files and the input source file. All these file paths are relative paths so the project stays portable. 4. Forces the report to run in the user’s current working directory instead of the working directory of the report. 5. Sets convenient default options such as `deployment = "main"` in the target and `quiet = TRUE` in `knitr::knit()`.

Value

A `tar_target()` object with `format = "file"`. When this target runs, it returns a character vector of file paths. The first file paths are the output files (returned by `knitr::knit()`) and the knitr source file is last. But unlike `knitr::knit()`, all returned paths are relative paths to ensure portability (so that the project can be moved from one file system to another without invalidating the target). See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.
For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir(# tar_dir() runs code from a temporary directory.
    targets::tar_script({
      # Ordinarily, you should create the report outside
      # tar_script() and avoid temporary files.
      lines <- c(
        "---",
        "title: report",
        "output_format: html_document",
        "---",
        ""
      )
      path <- tempfile()
      writeLines(lines, path)
      list(
        targets::tar_target(data, data.frame(x = seq_len(26), y = letters)),
        tarchetypes::tar_knit(report, path)
      )
    })
  targets::tar_make()
}
```

---

### tar_knitr_deps

List literate programming dependencies.

**Description**

List the target dependencies of one or more literate programming reports (R Markdown or knitr).

**Usage**

```r
tar_knitr_deps(path)
```
Arguments

path Character vector, path to one or more R Markdown or knitr reports.

Value

Character vector of the names of targets that are dependencies of the knitr report.

See Also

Other Literate programming utilities: tar_knitr_deps_expr(), tar_quarto_files()

Examples

```r
lines <- c(
  "---",
  "title: report",
  "output_format: html_document",
  "---",
  "```
  "targets::tar_load(data1)",
  "targets::tar_read(data2)",
  "```"
)
report <- tempfile()
writeLines(lines, report)
tar_knitr_deps(report)
```

Description

Construct an expression whose global variable dependencies are the target dependencies of one or more literate programming reports (R Markdown or knitr). This helps third-party developers create their own third-party target factories for literate programming targets (similar to tar_knit() and tar_render()).

Usage

tar_knitr_deps_expr(path)

Arguments

path Character vector, path to one or more R Markdown or knitr reports.

Value

Expression object to name the dependency targets of the knitr report, which will be detected in the static code analysis of targets.
See Also

Other Literate programming utilities: `tar_knitr_deps()`, `tar_quarto_files()`

Examples

```r
lines <- c(
  "---",
  "title: report",
  "output_format: html_document",
  "---",
  "targets::tar_load(data1)",
  "targets::tar_read(data2)",
  ""
)
report <- tempfile()
writeLines(lines, report)
tar_knitr_deps_expr(report)
```

---

`tar_knit_raw`

**Target with a knitr document (raw version).**

Description

Shorthand to include a knitr document in a `targets` pipeline (raw version)

Usage

```r
tar_knit_raw(
  name,
  path,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = "main",
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue"),
  quiet = TRUE,
  knit_arguments = quote(list())
)
```
Arguments

name  Character of length 1, name of the target.
path  Character string, file path to the knitr source file. Must have length 1.
packages  Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.
library  Character vector of library paths to try when loading packages.
error  Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory  Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection  Logical, whether to run base::gc() just before the target runs.

deployment  Character of length 1, only relevant to tar_make_clusterq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority  Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources  Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

retrieval  Character of length 1, only relevant to tar_make_clusterq() and tar_make_future(). Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

**cue**
An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

**quiet**
Boolean; suppress the progress bar and messages?

**knit_arguments**
Optional language object with a list of named arguments to `knitr::knit()`. Cannot be an expression object. (Use `quote()`, not `expression()`.) The reason for quoting is that these arguments may depend on upstream targets whose values are not available at the time the target is defined, and because `tar_knit_raw()` is the "raw" version of a function, we want to avoid all non-standard evaluation.

**Details**

`tar_knit_raw()` is just like `tar_knit()` except that it uses standard evaluation. The name argument is a character vector, and the `knit_arguments` argument is a language object.

**Value**

A `tar_target()` object with `format = "file"`. When this target runs, it returns a character vector of file paths. The first file paths are the output files (returned by `knitr::knit()`) and the knitr source file is last. But unlike `knitr::knit()`, all returned paths are relative paths to ensure portability (so that the project can be moved from one file system to another without invalidating the target). See the "Target objects" section for background.

**Target objects**

Most tar_chetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**See Also**

Other Literate programming targets: `tar_knit()`, `tar_quarto_raw()`, `tar_quarto_rep_raw()`, `tar_quarto_rep()`, `tar_quarto()`, `tar_render_raw()`, `tar_render_rep_raw()`, `tar_render_rep()`, `tar_render()`

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      # Ordinarily, you should create the report outside
```
# tar_script() and avoid temporary files.
lines <- c(
    "---",
    "title: report",
    "output_format: html_document",
    "---",
    """,
    "```\{r}\",
    "targets::tar_read(data)",
    "```"
)
path <- tempfile()
writeLines(lines, path)
list(
    targets::tar_target(data, data.frame(x = seq_len(26), y = letters)),
    tarchetypes::tar_knit_raw("report", path)
)  
)})
targets::tar_make()
}

---

## tar_map

### Static branching.

### Description

Define multiple new targets based on existing target objects.

### Usage

```r
 tar_map(values, ..., names = tidyselect::everything(), unlist = FALSE)
```

### Arguments

- **values**
  Named list or data frame with values to iterate over. The names are the names of symbols in the commands and pattern statements, and the elements are values that get substituted in place of those symbols. `tar_map()` uses these elements to create new R code, so they should be basic types, symbols, or R expressions. For objects even a little bit complicated, especially objects with attributes, it is not obvious how to convert the object into code that generates it. For complicated objects, consider using `quote()` when you define values, as shown at [https://github.com/ropensci/tarchetypes/discussions/105](https://github.com/ropensci/tarchetypes/discussions/105).

- **...**
  One or more target objects or list of target objects. Lists can be arbitrarily nested, as in `list()`.

- **names**
  Subset of `names(values)` used to generate the suffixes in the names of the new targets. You can supply symbols, a character vector, or tidyselect helpers like `starts_with()`.
unlist Logical, whether to flatten the returned list of targets. If unlist = FALSE, the list is nested and sub-lists are named and grouped by the original input targets. If unlist = TRUE, the return value is a flat list of targets named by the new target names.

Details
tar_map() creates collections of new targets by iterating over a list of arguments and substituting symbols into commands and pattern statements.

Value
A list of new target objects. If unlist is FALSE, the list is nested and sub-lists are named and grouped by the original input targets. If unlist = TRUE, the return value is a flat list of targets named by the new target names. See the “Target objects” section for background.

Target objects
Most tarctypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Other branching: tar_combine_raw(), tar_combine(), tar_map2_count_raw(), tar_map2_count(), tar_map2_raw(), tar_map2_size_raw(), tar_map2_size(), tar_map2(), tar_map_rep_raw(), tar_map_rep(), tar_rep2_raw(), tar_rep2(), tar_rep_map_raw(), tar_rep_map(), tar_rep_raw(), tar_rep()
Dynamic-within-static branching for data frames (count batching).

Description

Define targets for batched dynamic-within-static branching for data frames, where the user sets the (maximum) number of batches.

Usage

```r
tar_map2_count(
  name,
  command1,
  command2,
  values = NULL,
  names = NULL,
  batches = 1L,
  combine = TRUE,
  suffix1 = "1",
  suffix2 = "2",
  columns1 = tidyselect::everything(),
  columns2 = tidyselect::everything(),
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)
```

Arguments

- **name**: Symbol, base name of the targets.
- **command1**: R code to create named arguments to `command2`. Must return a data frame with one row per call to `command2`.
- **command2**: R code to map over the data frame of arguments produced by `command1`. Must return a data frame.
Values

Named list or data frame with values to iterate over. The names are the names of symbols in the commands and pattern statements, and the elements are values that get substituted in place of those symbols. `tar_map()` uses these elements to create new R code, so they should be basic types, symbols, or R expressions. For objects even a little bit complicated, especially objects with attributes, it is not obvious how to convert the object into code that generates it. For complicated objects, consider using `quote()` when you define values, as shown at [https://github.com/ropensci/tarchetypes/discussions/105](https://github.com/ropensci/tarchetypes/discussions/105).

Names

Language object with a tidyselect expression to select which columns of values to use to construct statically branched target names. If `NULL`, then short names are automatically generated.

Batches

Positive integer of length 1, maximum number of batches (dynamic branches within static branches) of the downstream (command2) targets. Batches are formed from row groups of the command1 target output.

Combine

Logical of length 1, whether to statically combine all the results into a single target downstream.

Suffix 1

Character of length 1, suffix to apply to the command1 targets to distinguish them from the command2 targets.

Suffix 2

Character of length 1, suffix to apply to the command2 targets to distinguish them from the command1 targets.

Columns 1

A tidyselect expression to select which columns of values to append to the output of all targets. Columns already in the target output are not appended.

Columns 2

A tidyselect expression to select which columns of command1 output to append to command2 output. Columns already in the target output are not appended. `columns1` takes precedence over `columns2`.

Tidy Eval

Logical, whether to enable tidy evaluation when interpreting command and pattern. If `TRUE`, you can use the "bang-bang" operator `!!` to programmatically insert the values of global objects.

Packages

Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

Library

Character vector of library paths to try when loading packages.

Format

Character of length 1, storage format of the output. An efficient data frame format like "feather" is recommended, but the default is "rds" to avoid incurring extra package dependencies. See the help file of `targets::tar_target()` for details on storage formats.

Repository

Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the `endpoint` argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for instructions.
• "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

error Character of length 1, what to do if the target stops and throws an error. Options:
• "stop": the whole pipeline stops and throws an error.
• "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
• "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
• "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
• "worker": the worker saves/uploads the value.
• "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it,
then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

• "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
• "worker": the worker loads the target’s dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

Details

Static branching creates one pair of targets for each row in values. In each pair, there is an upstream non-dynamic target that runs command1 and a downstream dynamic target that runs command2. command1 produces a data frame of arguments to command2, and command2 dynamically maps over these arguments in batches.

Value

A list of new target objects. See the “Target objects” section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Other branching: `tar_combine_raw()`, `tar_combine()`, `tar_map2_count_raw()`, `tar_map2_raw()`, `tar_map2_size_raw()`, `tar_map2_size()`, `tar_map2()`, `tar_map_rep_raw()`, `tar_map_rep()`, `tar_map()`, `tar_rep2_raw()`, `tar_rep2()`, `tar_rep_map_raw()`, `tar_rep_map()`, `tar_rep_raw()`, `tar_rep()`

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      tarchetypes::tar_map2_count(
        x,
        command1 = tibble::tibble(
          arg1 = arg1,
          arg2 = seq_len(6)
        ),
        command2 = tibble::tibble(
          result = paste(arg1, arg2),
          random = sample.int(1e9, size = 1),
          length_input = length(arg1)
        ),
        values = tibble::tibble(arg1 = letters[seq_len(2)]),
        batches = 3
      )
    })
    targets::tar_make()
    targets::tar_read(x)
  })
}
```

---

**Description**

Define targets for batched dynamic-within-static branching for data frames, where the user sets the (maximum) number of batches. Like `tar_map2_count()` except `name` is a character string and `command1`, `command2`, `names`, `columns1`, and `columns2` are all language objects.

**Usage**

```r
tar_map2_count_raw(
  name,
  command1,
  command2,
  values = NULL,
```
names = NULL,
batches = 1L,
combine = TRUE,
suffix1 = "1",
suffix2 = "2",
columns1 = quote(tidyselect::everything()),
columns2 = quote(tidyselect::everything()),
tidy_eval = targets::tar_option_get("tidy_eval"),
packages = targets::tar_option_get("packages"),
library = targets::tar_option_get("library"),
format = targets::tar_option_get("format"),
repository = targets::tar_option_get("repository"),
error = targets::tar_option_get("error"),
memory = targets::tar_option_get("memory"),
garbage_collection = targets::tar_option_get("garbage_collection"),
deployment = targets::tar_option_get("deployment"),
priority = targets::tar_option_get("priority"),
resources = targets::tar_option_get("resources"),
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

Arguments

name  Character of length 1, base name of the targets.

command1  Language object to create named arguments to command2. Must return a data frame with one row per call to command2.

command2  Language object to map over the data frame of arguments produced by command1. Must return a data frame.

values  Named list or data frame with values to iterate over. The names are the names of symbols in the commands and pattern statements, and the elements are values that get substituted in place of those symbols. tar_map() uses these elements to create new R code, so they should be basic types, symbols, or R expressions. For objects even a little bit complicated, especially objects with attributes, it is not obvious how to convert the object into code that generates it. For complicated objects, consider using quote() when you define values, as shown at https://github.com/ropensci/tarchetypes/discussions/105.

names  Language object with a tidyselect expression to select which columns of values to use to construct statically branched target names. If NULL, then short names are automatically generated.

batches  Positive integer of length 1, maximum number of batches (dynamic branches within static branches) of the downstream (command2) targets. Batches are formed from row groups of the command1 target output.

combine  Logical of length 1, whether to statically combine all the results into a single target downstream.
suffix1  Character of length 1, suffix to apply to the command1 targets to distinguish them from the command2 targets.

suffix2  Character of length 1, suffix to apply to the command2 targets to distinguish them from the command1 targets.

columns1  Language object, a tidyselect expression to select which columns of values to append to the output of all targets.

columns2  Language object, a tidyselect expression to select which columns of command1 output to append to command2 output. In case of conflicts, column1 takes precedence.

tidy_eval  Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

packages  Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library  Character vector of library paths to try when loading packages.

format  Character of length 1, storage format of the output. An efficient data frame format like "feather" is recommended, but the default is "rds" to avoid incurring extra package dependencies. See the help file of targets::tar_target() for details on storage formats.

repository  Character of length 1, remote repository for target storage. Choices:

  - "local": file system of the local machine.
  - "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
  - "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

  Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

target_error  Character of length 1, what to do if the target stops and throws an error. Options:

  - "stop": the whole pipeline stops and throws an error.
  - "continue": the whole pipeline keeps going.
  - "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
  - "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.
memory  Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection  Logical, whether to run base::gc() just before the target runs.

deployment  Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority  Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources  Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage  Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")'.

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval  Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
"worker": the worker loads the targets dependencies.

"none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

**cue**

An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

**Details**

Static branching creates one pair of targets for each row in `values`. In each pair, there is an upstream non-dynamic target that runs `command1` and a downstream dynamic target that runs `command2`. `command1` produces a data frame of arguments to `command2`, and `command2` dynamically maps over these arguments in batches.

**Value**

A list of new target objects. See the "Target objects" section for background.

**Target objects**

Most `tarchetypes` functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**See Also**

Other branching: `tar_combine_raw()`, `tar_combine()`, `tar_map2_count()`, `tar_map2_raw()`, `tar_map2_size_raw()`, `tar_map2_size()`, `tar_map2()`, `tar_map_rep_raw()`, `tar_map_rep()`, `tar_map()`, `tar_rep2_raw()`, `tar_rep2()`, `tar_rep_map_raw()`, `tar_rep_map()`, `tar_rep_raw()`, `tar_rep()`

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      tarchetypes::tar_map2_count_raw(
        "x",
        command1 = quote(tibble::tibble(
          arg1 = arg1,
          arg2 = seq_len(6)
        )
      ),
    ),
  )
```
Define targets for batched dynamic-within-static branching for data frames, where the user sets the (maximum) size of each batch.

Usage

tar_map2_size(
  name,
  command1,
  command2,
  values = NULL,
  names = NULL,
  size = Inf,
  combine = TRUE,
  suffix1 = "1",
  suffix2 = "2",
  columns1 = tidyselect::everything(),
  columns2 = tidyselect::everything(),
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
)
resources = targets::tar_option_get("resources"),
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

**Arguments**

**name**
Symbol, base name of the targets.

**command1**
R code to create named arguments to command2. Must return a data frame with one row per call to command2.

**command2**
R code to map over the data frame of arguments produced by command1. Must return a data frame.

**values**
Named list or data frame with values to iterate over. The names are the names of symbols in the commands and pattern statements, and the elements are values that get substituted in place of those symbols. `tar_map()` uses these elements to create new R code, so they should be basic types, symbols, or R expressions. For objects even a little bit complicated, especially objects with attributes, it is not obvious how to convert the object into code that generates it. For complicated objects, consider using `quote()` when you define values, as shown at [https://github.com/ropensci/tarchetypes/discussions/105](https://github.com/ropensci/tarchetypes/discussions/105).

**names**
Language object with a tidyselect expression to select which columns of values to use to construct statically branched target names. If NULL, then short names are automatically generated.

**size**
Positive integer of length 1, maximum number of rows in each batch for the downstream (command2) targets. Batches are formed from row groups of the command1 target output.

**combine**
Logical of length 1, whether to statically combine all the results into a single target downstream.

**suffix1**
Character of length 1, suffix to apply to the command1 targets to distinguish them from the command2 targets.

**suffix2**
Character of length 1, suffix to apply to the command2 targets to distinguish them from the command1 targets.

**columns1**
A tidyselect expression to select which columns of values to append to the output of all targets. Columns already in the target output are not appended.

**columns2**
A tidyselect expression to select which columns of command1 output to append to command2 output. Columns already in the target output are not appended. `columns1` takes precedence over `columns2`.

**tidy_eval**
Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator `!!` to programmatically insert the values of global objects.

**packages**
Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

**library**
Character vector of library paths to try when loading packages.
format

Character of length 1, storage format of the output. An efficient data frame format like "feather" is recommended, but the default is "rds" to avoid incurring extra package dependencies. See the help file of targets::tar_target() for details on storage formats.

repository

Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

error

Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory

Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection

Logical, whether to run base::gc() just before the target runs.

deployment

Character of length 1, only relevant to tar_make_clusterMq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority

Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).
resources Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

storage Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when `retrieval = "none"`).

retrieval Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Details

Static branching creates one pair of targets for each row in `values`. In each pair, there is an upstream non-dynamic target that runs `command1` and a downstream dynamic target that runs `command2`. `command1` produces a data frame of arguments to `command2`, and `command2` dynamically maps over these arguments in batches.

Value

A list of new target objects. See the “Target objects” section for background.

tar_map2_size_raw  
Dynamic-within-static branching for data frames (size batching: raw version).
Description

Define targets for batched dynamic-within-static branching for data frames, where the user sets the (maximum) size of each batch. Like tar_map2_size() except name is a character string and command1, command2, names, columns1, and columns2 are all language objects.

Usage

tar_map2_size_raw(
  name,  # Character of length 1, base name of the targets.
  command1,  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  command2,  # Language object to map over the data frame of arguments produced by command1. Must return a data frame.
  values = NULL,  # Named list or data frame with values to iterate over. The names are the names of symbols in the commands and pattern statements, and the elements are values that get substituted in place of those symbols. tar_map() uses these elements to create new R code, so they should be basic types, symbols, or R expressions. For objects even a little bit complicated, especially objects with attributes, it is not
  names = NULL,  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  size = Inf,  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  combine = TRUE,  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  suffix1 = "1",  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  suffix2 = "2",  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  columns1 = quote(tidyselect::everything()),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  columns2 = quote(tidyselect::everything()),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  tidy_eval = targets::tar_option_get("tidy_eval"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  packages = targets::tar_option_get("packages"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  library = targets::tar_option_get("library"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  format = targets::tar_option_get("format"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  repository = targets::tar_option_get("repository"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  error = targets::tar_option_get("error"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  memory = targets::tar_option_get("memory"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  garbage_collection = targets::tar_option_get("garbage_collection"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  deployment = targets::tar_option_get("deployment"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  priority = targets::tar_option_get("priority"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  resources = targets::tar_option_get("resources"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  storage = targets::tar_option_get("storage"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  retrieval = targets::tar_option_get("retrieval"),  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
  cue = targets::tar_option_get("cue")  # Language object to create named arguments to command2. Must return a data frame with one row per call to command2.
)
obvious how to convert the object into code that generates it. For complicated objects, consider using `quote()` when you define `values`, as shown at https://github.com/ropensci/tarchetypes/discussions/105.

**names**
Language object with a tidyselect expression to select which columns of `values` to use to construct statically branched target names. If `NULL`, then short names are automatically generated.

**size**
Positive integer of length 1, maximum number of rows in each batch for the downstream (command2) targets. Batches are formed from row groups of the command1 target output.

**combine**
Logical of length 1, whether to statically combine all the results into a single target downstream.

**suffix1**
Character of length 1, suffix to apply to the command1 targets to distinguish them from the command2 targets.

**suffix2**
Character of length 1, suffix to apply to the command2 targets to distinguish them from the command1 targets.

**columns1**
Language object, a tidyselect expression to select which columns of `values` to append to the output of all targets.

**columns2**
Language object, a tidyselect expression to select which columns of command1 output to append to command2 output. In case of conflicts, `column1` takes precedence.

**tidy_eval**
Logical, whether to enable tidy evaluation when interpreting command and pattern. If `TRUE`, you can use the "bang-bang" operator `!!` to programmatically insert the values of global objects.

**packages**
Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

**library**
Character vector of library paths to try when loading packages.

**format**
Character of length 1, storage format of the output. An efficient data frame format like "feather" is recommended, but the default is "rds" to avoid incurring extra package dependencies. See the help file of `targets::tar_target()` for details on storage formats.

**repository**
Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if `repository` is not "local" and `format` is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.
error Character of length 1, what to do if the target stops and throws an error. Options:
  - "stop": the whole pipeline stops and throws an error.
  - "continue": the whole pipeline keeps going.
  - "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
  - "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If " transient", the target is unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and " transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
  - "main": the target's return value is sent back to the host machine and saved/uploaded locally.
  - "worker": the worker saves/uploads the value.
  - "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").
    If you select storage = "none", then the return value of the target's command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to...
The distinguishing feature of `storage = "none"` (as opposed to `format = "file"`) is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, `storage = "none"` is completely unnecessary if `format` is "file".

retrieval  Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
  - "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
  - "worker": the worker loads the targets dependencies.
  - "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue  An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Details

Static branching creates one pair of targets for each row in `values`. In each pair, there is an upstream non-dynamic target that runs `command1` and a downstream dynamic target that runs `command2`. `command1` produces a data frame of arguments to `command2`, and `command2` dynamically maps over these arguments in batches.

Value

A list of new target objects. See the "Target objects" section for background.

Target objects

Most `tarchetypes` functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      tarchetypes::tar_map2_size_raw(
        "x",
        command1 = quote(tibble::tibble(
          arg1 = arg1,
          arg2 = seq_len(6)
        )
      ),
      command2 = quote(tibble::tibble(
        result = paste(arg1, arg2),
        random = sample.int(1e6, size = 1),
        length_input = length(arg1)
      )
      ),
      values = tibble::tibble(arg1 = letters[seq_len(2)]),
      size = 2
    )
  )
  targets::tar_make()
  targets::tar_read(x)
}
```

```
tar_map_rep

Dynamic batched replication within static branches for data frames.

Description

Define targets for batched replication within static branches for data frames.

Usage

```
tar_map_rep(
  name,
  command,
  values = NULL,
  names = NULL,
  columns = tidyselect::everything(),
  batches = 1,
  reps = 1,
  combine = TRUE,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
```
format = targets::tar_option_get("format"),
repository = targets::tar_option_get("repository"),
error = targets::tar_option_get("error"),
memory = targets::tar_option_get("memory"),
garbage_collection = targets::tar_option_get("garbage_collection"),
deployment = targets::tar_option_get("deployment"),
priority = targets::tar_option_get("priority"),
resources = targets::tar_option_get("resources"),
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target's initial RNG state.

command R code for a single replicate. Must return a data frame.

values Named list or data frame with values to iterate over. The names are the names of symbols in the commands and pattern statements, and the elements are values that get substituted in place of those symbols. tar_map() uses these elements to create new R code, so they should be basic types, symbols, or R expressions. For objects even a little bit complicated, especially objects with attributes, it is not obvious how to convert the object into code that generates it. For complicated objects, consider using quote() when you define values, as shown at https://github.com/ropensci/tarchetypes/discussions/105.

names Language object with a tidyselect expression to select which columns of values to use to construct statically branched target names. If NULL, then short names are automatically generated.

columns A tidyselect expression to select which columns of values to append to the output. Columns already in the target output are not appended.

batches Number of batches. This is also the number of dynamic branches created during tar_make().

reps Number of replications in each batch. The total number of replications is batches * reps.

combine Logical of length 1, whether to statically combine all the results into a single target downstream.
tidy_eval Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Character of length 1, storage format of the output. An efficient data frame format like "feather" is recommended, but the default is "rds" to avoid incurring extra package dependencies. See the help file of targets::tar_target() for details on storage formats.

repository Character of length 1, remote repository for target storage. Choices:
  - "local": file system of the local machine.
  - "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
  - "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

error Character of length 1, what to do if the target stops and throws an error. Options:
  - "stop": the whole pipeline stops and throws an error.
  - "continue": the whole pipeline keeps going.
  - "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
  - "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.
garbage_collection
Logical, whether to run base::gc() just before the target runs.

deployment
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources
Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none").

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue
An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

Value
A list of new target objects. See the “Target objects” section for background.
Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      # Just a sketch of a Bayesian sensitivity analysis of hyperparameters:
      assess_hyperparameters <- function(sigma1, sigma2) {
        # data <- simulate_random_data() # user-defined function
        # run_model(data, sigma1, sigma2) # user-defined function
        # Mock output from the model:
        posterior_samples <- stats::rnorm(1000, 0, sigma1 + sigma2)
        tibble::tibble(
          posterior_median = median(posterior_samples),
          posterior_quantile_0.025 = quantile(posterior_samples, 0.025),
          posterior_quantile_0.975 = quantile(posterior_samples, 0.975)
        )
      }
      hyperparameters <- c("tight", "medium", "diffuse")
      sigma1 = c(10, 50, 50),
      sigma2 = c(10, 5, 10)
    })
  }
```
Dynamic batched replication within static branches for data frames (raw version).

**Description**

Define targets for batched replication within static branches for data frames (raw version).

This function is like `tar_map_rep()` except the name argument is a character string and the names and columns arguments are language objects.

**Usage**

```r
tar_map_rep_raw(
  name,
  command, 
  values = NULL, 
  names = NULL, 
  columns = quote(tidyselect::everything()), 
  batches = 1, 
  reps = 1, 
  combine = TRUE, 
  tidy_eval = targets::tar_option_get("tidy_eval"), 
  packages = targets::tar_option_get("packages"), 
  library = targets::tar_option_get("library"), 
  format = targets::tar_option_get("format"), 
  repository = targets::tar_option_get("repository"), 
  error = targets::tar_option_get("error"), 
  memory = targets::tar_option_get("memory"), 
  garbage_collection = targets::tar_option_get("garbage_collection"), 
  deployment = targets::tar_option_get("deployment"), 
  priority = targets::tar_option_get("priority"), 
  resources = targets::tar_option_get("resources"), 
  storage = targets::tar_option_get("storage"), 
  retrieval = targets::tar_option_get("retrieval"), 
)
\begin{verbatim}

cue = targets::tar_option_get("cue")

\end{verbatim}

**Arguments**

- `name` Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target's initial RNG state.

- `command` Language object, R code for a single replicate. Must return a data frame.

- `values` Named list or data frame with values to iterate over. The names are the names of symbols in the commands and pattern statements, and the elements are values that get substituted in place of those symbols. `tar_map()` uses these elements to create new R code, so they should be basic types, symbols, or R expressions. For objects even a little bit complicated, especially objects with attributes, it is not obvious how to convert the object into code that generates it. For complicated objects, consider using `quote()` when you define `values`, as shown at https://github.com/ropensci/tarchetypes/discussions/105.

- `names` Language object with a tidyselect expression to select which columns of `values` to use to construct statically branched target names. If `NULL`, then short names are automatically generated.

- `columns` Language object with a tidyselect expression to select which columns of `values` to append to the output. Columns already in the target output are not appended.

- `batches` Number of batches. This is also the number of dynamic branches created during `tar_make()`.

- `reps` Number of replications in each batch. The total number of replications is `batches * reps`.

- `combine` Logical of length 1, whether to statically combine all the results into a single target downstream.

- `tidy_eval` Logical, whether to enable tidy evaluation when interpreting `command` and `pattern`. If `TRUE`, you can use the "bang-bang" operator `!!` to programmatically insert the values of global objects.

- `packages` Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

- `library` Character vector of library paths to try when loading packages.

- `format` Character of length 1, storage format of the output. An efficient data frame format like "feather" is recommended, but the default is "rds" to avoid incurring
extra package dependencies. See the help file of `targets::tar_target()` for details on storage formats.

**repository** Character of length 1, remote repository for target storage. Choices:
- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for instructions.

Note: if `repository` is not "local" and `format` is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

**error** Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns `NULL`. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

**memory** Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless `storage` is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. `format = "file"` with `repository = "aws"`), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

**garbage_collection** Logical, whether to run `base::gc()` just before the target runs.

**deployment** Character of length 1, only relevant to `tar_make_clustermsg()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

**priority** Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).
resources  Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

storage   Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when `retrieval = "none"`).

If you select `storage = "none"`, then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (`format = "file"`) it is the responsibility of the user to write to `tar_path()` from inside the target. An example target could look something like `tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")`. The distinguishing feature of `storage = "none"` (as opposed to `format = "file"`) is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if `format` is "file".

retrieval  Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue   An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Value

A list of new target objects. See the "Target objects" section for background.

        posterior_samples <- stats::rnorm(1000, 0, sigma1 + sigma2)
        tibble::tibble(
          posterior_median = median(posterior_samples),
          posterior_quantile_0.025 = quantile(posterior_samples, 0.025),
          posterior_quantile_0.975 = quantile(posterior_samples, 0.975)
        )
      }
      hyperparameters <- tibble::tibble(  
        scenario = c("tight", "medium", "diffuse"),
        sigma1 = c(10, 50, 50),
        sigma2 = c(10, 5, 10)
      )
      tarchetypes::tar_map_rep_raw("sensitivity_analysis",
        command = quote(assess_hyperparameters(sigma1, sigma2)),
        values = hyperparameters,
        names = quote(tidyselect::any_of("scenario")),
        batches = 2,
        reps = 3
      )
    })
  }
}
```
Description

Simplify target specification in pipelines.

Usage

tar_plan(...)

Arguments

... Named and unnamed targets. All named targets must follow the drake-plan-like
target = command syntax, and all unnamed arguments must be explicit calls to
create target objects, e.g. tar_target(). target archetypes like tar_render(),
or similar.

Details

Allows targets with just targets and commands to be written in the pipeline as target = command
instead of tar_target(target, command). Also supports ordinary target objects if they are un-
named. tar_plan(x = 1, y = 2, tar_target(z, 3), tar_render(r, "r.Rmd")) is equivalent to
list(tar_target(x, 1), tar_target(y, 2), tar_target(z, 3), tar_render(r, "r.Rmd")).

Value

A list of tar_target() objects. See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists
of target objects. Target objects represent skippable steps of the analysis pipeline as described
at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis
pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories
explains target factories (functions like this one which generate targets) and the design specifica-
tion at https://books.ropensci.org/targets-design/ details the structure and composition
of target objects.
Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
    targets::tar_dir({  # tar_dir() runs code from a temporary directory.
        targets::tar_script({
            library(tarchetypes)
            tar_plan(
                tarchetypes::tar_fst_tbl(data, data.frame(x = seq_len(26)));
                means = colMeans(data) # No need for tar_target() for simple cases.
            )
        })
    })
    targets::tar_make()
}
```

**Description**

Shorthand to include a Quarto project in a `targets` pipeline.

**Usage**

```r
tar_quarto(
    name,
    path = ".",
    extra_files = character(0),
    execute = TRUE,
    execute_params = list(),
    cache = NULL,
    cache_refresh = FALSE,
    debug = FALSE,
    quiet = TRUE,
    pandoc_args = NULL,
    tidy_eval = targets::tar_option_get("tidy_eval"),
    packages = targets::tar_option_get("packages"),
    library = targets::tar_option_get("library"),
    error = targets::tar_option_get("error"),
    memory = targets::tar_option_get("memory"),
    garbage_collection = targets::tar_option_get("garbage_collection"),
    deployment = "main",
    priority = targets::tar_option_get("priority"),
    resources = targets::tar_option_get("resources"),
    retrieval = targets::tar_option_get("retrieval"),
    cue = targets::tar_option_get("cue")
)
```
Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

path Character of length 1, either the single * . qmd source file to be rendered or a directory containing a Quarto project. Defaults to the working directory of the targets pipeline. Passed directly to the input argument of quarto::quarto_render().

eextra_files Character vector of extra files and directories to track for changes. The target will be invalidated (rerun on the next tar_make()) if the contents of these files changes. No need to include anything already in the output of tar_quarto_files(), the list of file dependencies automatically detected through quarto::quarto_inspect().

execute Whether to execute embedded code chunks.

eexecute_params Code, cannot be NULL. execute_params evaluates to a named list of parameters for parameterized Quarto documents. These parameters override the custom custom elements of the params list in the YAML front-matter of the Quarto source files. The list is quoted (not evaluated until the target runs) so that upstream targets can serve as parameter values.

cache Cache execution output (uses knitr cache and jupyter-cache respectively for Rmd and Jupyter input files).

cache_refresh Force refresh of execution cache.

ddebug Leave intermediate files in place after render.

dquiet Suppress warning and other messages.

dpandoc_args Additional command line options to pass to pandoc.

dtidy_eval Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

dpackages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

dlibrary Character vector of library paths to try when loading packages.

derror Character of length 1, what to do if the target stops and throws an error. Options:
  • "stop": the whole pipeline stops and throws an error.
  • "continue": the whole pipeline keeps going.
  • "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
"null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

**memory** Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

**garbage_collection** Logical, whether to run base::gc() just before the target runs.

**deployment** Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

**priority** Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

**resources** Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

**retrieval** Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

**cue** An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

### Details

tar_quarto() is an alternative to tar_target() for Quarto projects and standalone Quarto source documents that depend on upstream targets. The Quarto R source documents (*.qmd and *.Rmd files) should mention dependency targets with tar_load() and tar_read() in the active R code chunks (which also allows you to render the project outside the pipeline if the _targets/_data store already exists). (Do not use tar_load_raw() or tar_read_raw() for this.) Then, tar_quarto() defines a special kind of target. It 1. Finds all the tar_load()/tar_read() dependencies in the R source reports and inserts them into the target’s command. This enforces the proper dependency relationships. (Do not use tar_load_raw() or tar_read_raw() for this.) 2. Sets format = "file"
(see tar_target()) so targets watches the files at the returned paths and reruns the report if those files change. 3. Configures the target’s command to return both the output rendered files and the input dependency files (such as Quarto source documents). All these file paths are relative paths so the project stays portable. 4. Forces the report to run in the user’s current working directory instead of the working directory of the report. 5. Sets convenient default options such as deployment = "main" in the target and quiet = TRUE in quarto::quarto_render().

Value

A target object with format = "file". When this target runs, it returns a character vector of file paths: the rendered documents, the Quarto source files, and other input and output files. The output files are determined by the YAML front-matter of standalone Quarto documents and _quarto.yml in Quarto projects, and you can see these files with tar_quarto_files() (powered by quarto::quarto_inspect()). All returned paths are relative paths to ensure portability (so that the project can be moved from one file system to another without invalidating the target). See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    # Unparameterized Quarto document:
    lines <- c(
      "---",
      "title: report.qmd source file",
      "output_format: html",
      "---",
      "Assume these lines are in report.qmd.",
      "\"\"{r}\"\"
    )
  } )
  writeLines(lines, "report.qmd")
# Include the report in a pipeline as follows.
targets::tar_script(
  library(tarchetypes)
  list(
    tar_target(data, data.frame(x = seq_len(26), y = letters)),
    tar_quarto(report, path = "report.qmd")
  ), ask = FALSE)
# Then, run the pipeline as usual.

# Parameterized Quarto:
lines <- c(
  "---",
  "title: 'report.qmd source file with parameters'",
  "output_format: html_document",
  "params:",
  " your_param: \"default value\"",
  "---",
  "Assume these lines are in report.qmd.",
  "\"{r}\",
  "print(params$your_param)",
  "\"
)
writeLines(lines, "report.qmd")
# Include the report in the pipeline as follows.
unlink("_targets.R") # In tar_dir(), not the user's file space.
targets::tar_script(
  library(tarchetypes)
  list(
    tar_target(data, data.frame(x = seq_len(26), y = letters)),
    tar_quarto(
      report,
      path = "report.qmd",
      execute_params = list(your_param = data)
    )
  ), ask = FALSE)
) # Then, run the pipeline as usual.

---

**tar_quarto_files**

**Quarto file detection**

**Description**

Detect the important files in a Quarto project.

**Usage**

```
tar_quarto_files(path = ".")
```
Arguments

path  Character of length 1, either the file path to a Quarto source document or the directory path to a Quarto project. Defaults to the Quarto project in the current working directory.

Details

This function is just a thin wrapper that interprets the output of `quarto::quarto.inspect()` and returns what `tarchetypes` needs to know about the current Quarto project or document.

Value

A named list of important file paths in a Quarto project or document:

- sources: source files with `tar_load()`/`tar_read()` target dependencies in R code chunks.
- output: output files that will be generated during `quarto::quarto_render()`.
- input: pre-existing files required to render the project or document, such as `_quarto.yml`.

See Also

Other Literate programming utilities: `tar_knitr_deps_expr()`, `tar_knitr_deps()`

Examples

```r
lines <- c(
  "---",
  "title: source file",
  "---",
  "Assume these lines are in report.qmd.",
  "\"\"\"(r)\"\"",
  "1 + 1",
  "\"\"\"
)
path <- tempfile(fileext = ".qmd")
writeLines(lines, path)
# If Quarto is installed, run:
# tar_quarto_files(path)
```

Description

Shorthand to include a Quarto project or standalone Quarto source document in a `targets` pipeline.
Usage

tar_quarto_raw(
  name,
  path = ".",
  extra_files = character(0),
  execute = TRUE,
  execute_params = NULL,
  cache = NULL,
  cache_refresh = FALSE,
  debug = FALSE,
  quiet = TRUE,
  pandoc_args = NULL,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = "main",
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue"
)
)

Arguments

name Character of length 1, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

path Character of length 1, either the single *.qmd source file to be rendered or a directory containing a Quarto project. Defaults to the working directory of the targets pipeline. Passed directly to the input argument of quarto::quarto_render().

extra_files Character vector of extra files and directories to track for changes. The target will be invalidated (rerun on the next tar_make()) if the contents of these files changes. No need to include anything already in the output of tar_quarto_files(), the list of file dependencies automatically detected through quarto::quarto_inspect().

execute Whether to execute embedded code chunks.

execute_params A non-expression language object (use quote(), not expression()) that evaluates to a named list of parameters for parameterized Quarto documents. These
parameters override the custom custom elements of the params list in the YAML front-matter of the Quarto source files. The list is quoted (not evaluated until the target runs) so that upstream targets can serve as parameter values.

```
cache
```
Cache execution output (uses knitr cache and jupyter-cache respectively for Rmd and Jupyter input files).

```
cache_refresh
```
Force refresh of execution cache.

```
debug
```
Leave intermediate files in place after render.

```
quiet
```
Suppress warning and other messages.

```
pandoc_args
```
Additional command line options to pass to pandoc.

```
packages
```
Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

```
library
```
Character vector of library paths to try when loading packages.

```
error
```
Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

```
memory
```
Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

```
garbage_collection
```
Logical, whether to run `base::gc()` just before the target runs.

```
deployment
```
Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

```
priority
```
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

```
resources
```
Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.
retrieval Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Details

`tar_quarto_raw()` is just like `tar_quarto()` except that it uses standard evaluation for the name and `execute_params` arguments (instead of quoting them).

Value

A target object with `format = "file"`. When this target runs, it returns a sorted character vector of all the important file paths: the rendered documents, the Quarto source files, and other input and output files. The output files are determined by the YAML front-matter of standalone Quarto documents and `_quarto.yml` in Quarto projects, and you can see these files with `tar_quarto_files()` (powered by `quarto::quarto_inspect()`). All returned paths are relative paths to ensure portability (so that the project can be moved from one file system to another without invalidating the target). See the "Target objects" section for background.

Target objects

Most `tarchetypes` functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    # Unparameterized Quarto document:
    lines <- c(
```
"---",
"title: report.qmd source file",
"output_format: html",
"---",
"Assume these lines are in report.qmd.",
"```r",
"targets::tar_read(data)",
"```"

# In tar_dir(), not part of the user's file space:
writeLines(lines, "report.qmd")
# Include the report in a pipeline as follows.
targets::tar_script(
  library(tarchetypes)
  list(
    tar_target(data, data.frame(x = seq_len(26), y = letters)),
    tar_quarto_raw("report", path = "report.qmd")
  )
), ask = FALSE)
# Then, run the pipeline as usual.

# Parameterized Quarto:
lines <- c(
  "---",
  "title: 'report.qmd source file with parameters'",
  "output_format: html_document",
  "params:",
  "your_param: "default value"",
  "---",
  "Assume these lines are in report.qmd.",
  "```r",
  "print(params$your_param)",
  "```"
)
# In tar_dir(), not part of the user's file space:
writeLines(lines, "report.qmd")
# Include the report in the pipeline as follows.
targets::tar_script(
  library(tarchetypes)
  list(
    tar_target(data, data.frame(x = seq_len(26), y = letters)),
    tar_quarto_raw("report", path = "report.qmd",
    execute_params = quote(list(your_param = data))
  )
), ask = FALSE)
# Then, run the pipeline as usual.

}
Parameterized Quarto with dynamic branching.

**Description**

Targets to render a parameterized Quarto document with multiple sets of parameters.

**Usage**

```r
tar_quarto_rep(
  name,
  path,
  execute_params = data.frame(),
  batches = NULL,
  extra_files = character(0),
  execute = TRUE,
  cache = NULL,
  cache_refresh = FALSE,
  debug = FALSE,
  quiet = TRUE,
  pandoc_args = NULL,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)
```

**Arguments**

- **name** (Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even...
dynamic branches have different names and thus different seeds.) You can re-
cover the seed of a completed target with `tar_meta(your_target, seed)` and
run `set.seed()` on the result to locally recreate the target’s initial RNG state.

**path**
Character string, file path to the Quarto source file. Must have length 1.

**execute_params**
Code to generate a data frame or tibble with one row per rendered report and
one column per Quarto parameter. You may also include an output_file column to specify the path of each rendered report. If included, the output_file column must be a character vector with one and only one output file for each row of parameters. If an output_file column is not included, then the output files are automatically determined using the parameters, and the default file format is determined by the YAML front-matter of the Quarto source document. Only the first file format is used, the others are not generated. Quarto parameters must not be named `tar_group` or `output_file`. This `execute_params` argument is converted into the command for a target that supplies the Quarto parameters.

**batches**
Number of batches to group the Quarto files. For a large number of reports,
increase the number of batches to decrease target-level overhead. Defaults to
the number of reports to render (1 report per batch).

**extra_files**
Character vector of extra files that targets should track for changes. If the
content of one of these files changes, then the report will rerun over all the
parameters on the next `tar_make()`. These files are extra files, and they do not include the Quarto source document or rendered output document, which are already tracked for changes. Examples include bibliographies, style sheets, and supporting image files.

**execute**
Whether to execute embedded code chunks.

**cache**
Cache execution output (uses knitr cache and jupyter-cache respectively for Rmd and Jupyter input files).

**cache_refresh**
Force refresh of execution cache.

**debug**
Leave intermediate files in place after render.

**quiet**
Suppress warning and other messages.

**pandoc_args**
Additional command line options to pass to pandoc.

**tidy_eval**
Logical of length 1, whether to use tidy evaluation to resolve `execute_params`. Similar to the `tidy_eval` argument of `targets::tar_target()`.

**packages**
Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

**library**
Character vector of library paths to try when loading packages.

**format**
Optional storage format for the target’s return value. With the exception of `format = "file"`, each target gets a file in `_targets/objects`, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

**iteration**
Character of length 1, name of the iteration mode of the target. Choices:
- "vector": branching happens with `vctrs::vec_slice()` and aggregation happens with `vctrs::vec_c()`.
- "list": branching happens with `[[ ]]` and aggregation happens with `list()`.
• "group": `dplyr::group_by()`-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with `dplyr::group_by()`.

error
Character of length 1, what to do if the target stops and throws an error. Options:
• "stop": the whole pipeline stops and throws an error.
• "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)
• "null": The errored target continues and returns `NULL`. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory
Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. `format = "file" with repository = "aws"`), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection
Logical, whether to run `base::gc()` just before the target runs.

deployment
Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources
Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

retrieval
Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
• "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
• "worker": the worker loads the targets dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.
cue

An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Details

tar_quarto_rep() is an alternative to `tar_target()` for a parameterized Quarto document that depends on other targets. Parameters must be given as a data frame with one row per rendered report and one column per parameter. An optional `output_file` column may be included to set the output file path of each rendered report. (See the `execute_params` argument for details.)

The Quarto source should mention other dependency targets `tar_load()` and `tar_read()` in the active code chunks (which also allows you to render the report outside the pipeline if the `_targets/` data store already exists and appropriate defaults are specified for the parameters). (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) Then, `tar_quarto()` defines a special kind of target. It

1. Finds all the `tar_load()`,`tar_read()` dependencies in the report and inserts them into the target’s command. This enforces the proper dependency relationships. (Do not use `tar_load_raw()` or `tar_read_raw()` for this.)
2. Sets `format = "file"` (see `tar_target()`) so `targets` watches the files at the returned paths and reruns the report if those files change.
3. Configures the target’s command to return the output report files: the rendered document, the source file, and file paths mentioned in `files`. All these file paths are relative paths so the project stays portable.
4. Forces the report to run in the user’s current working directory instead of the working directory of the report.
5. Sets convenient default options such as `deployment = "main"` in the target and `quiet = TRUE` in `quarto::quarto_render()`.

Value

A list of target objects to render the Quarto reports. Changes to the parameters, source file, dependencies, etc. will cause the appropriate targets to rerun during `tar_make()`. See the “Target objects” section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
```
Parameterized Quarto with dynamic branching (raw version).

Description

Targets to render a parameterized Quarto document with multiple sets of parameters (raw version). Same as tar_quarto_rep() except name is a character string, params is an expression object, and extra arguments to quarto::quarto_render() are passed through the args argument instead of ...

Usage

tar_quarto_rep_raw(
  name,
  path,
  execute_params = expression(NULL),
  batches = NULL,
  extra_files = character(0),
  execute = TRUE,
  ...
Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in
R, and it must not start with a dot. Subsequent targets can refer to this name sym-
bolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can re-
cover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

path Character string, file path to the Quarto source file. Must have length 1.

execute_params Expression object with code to generate a data frame or tibble with one row per rendered report and one column per Quarto parameter. You may also in-
clude an output_file column to specify the path of each rendered report. If included, the output_file column must be a character vector with one and
only one output file for each row of parameters. If an output_file column is
not included, then the output files are automatically determined using the pa-
rameters, and the default file format is determined by the YAML front-matter of
the Quarto source document. Only the first file format is used, the others are not
generated. Quarto parameters must not be named tar_group or output_file.
This execute_params argument is converted into the command for a target that supplies the Quarto parameters.

batches Number of batches to group the Quarto files. For a large number of reports, increase the number of batches to decrease target-level overhead. Defaults to
the number of reports to render (1 report per batch).
extra_files  Character vector of extra files that targets should track for changes. If the content of one of these files changes, then the report will rerun over all the parameters on the next tar_make(). These files are extra files, and they do not include the Quarto source document or rendered output document, which are already tracked for changes. Examples include bibliographies, style sheets, and supporting image files.

execute  Whether to execute embedded code chunks.

cache  Cache execution output (uses knitr cache and jupyter-cache respectively for Rmd and Jupyter input files).

cache_refresh  Force refresh of execution cache.

debug  Leave intermediate files in place after render.

quiet  Suppress warning and other messages.

pandoc_args  Additional command line options to pass to pandoc.

packages  Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library  Character vector of library paths to try when loading packages.

format  Character of length 1, format argument to tar_target() to store the data frame of Quarto parameters.

iteration  Character of length 1, iteration argument to tar_target() for the Quarto documents. Does not apply to the target with Quarto parameters (whose iteration is always "group").

error  Character of length 1, what to do if the target stops and throws an error. Options:
  • "stop": the whole pipeline stops and throws an error.
  • "continue": the whole pipeline keeps going.
  • "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
  • "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory  Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection  Logical, whether to run base::gc() just before the target runs.
deployment Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

retrieval Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Details

tar_quarto_rep_raw() is an alternative to `tar_target_raw()` for parameterized Quarto reports that depend on other targets. Parameters must be given as a data frame with one row per rendered report and one column per parameter. An optional output_file column may be included to set the output file path of each rendered report. (See the execute_params argument for details.)

The Quarto source should mention other dependency targets `tar_load()` and `tar_read()` in the active code chunks (which also allows you to render the report outside the pipeline if the _targets/_data store already exists and appropriate defaults are specified for the parameters). (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) Then, `tar_quarto()` defines a special kind of target. It 1. Finds all the `tar_load()`/`tar_read()` dependencies in the report and inserts them into the target’s command. This enforces the proper dependency relationships. (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) 2. Sets format = "file" (see `tar_target()`) so targets watches the files at the returned paths and reruns the report if those files change. 3. Configures the target’s command to return the output report files: the rendered document, the source file, and then the *_files/ directory if it exists. All these file paths are relative paths so the project stays portable. 4. Forces the report to run in the user’s current working directory instead of the working directory of the report. 5. Sets convenient default options such as deployment = "main" in the target and quiet = TRUE in quarto::quarto_render().

Value

A list of target objects to render the Quarto reports. Changes to the parameters, source file, dependencies, etc. will cause the appropriate targets to rerun during `tar_make()`. See the “Target objects” section for background.
Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Other Literate programming targets: tar_knit_raw(), tar_knit(), tar_quarto_raw(), tar_quarto_rep(), tar_quarto(), tar_render_raw(), tar_render_rep_raw(), tar_render_rep(), tar_render()

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    # Parameterized Quarto:
    lines <- c(
      "---",
      "title: 'report.qmd source file'",
      "output_format: html_document",
      "params:",
      "  par: "default value",
      "---",
      "Assume these lines are in a file called report.qmd."
    ),
    "\"\"r\"\"
  )
  writeLines(lines, "report.qmd") # In tar_dir(), not the user's file space.
  # The following pipeline will run the report for each row of params.
  targets::tar_script({
    library(tarchetypes)
    list(
      tar_quarto_rep_raw(  
        "report",
        path = "report.qmd",
        execute_params = quote(tibble::tibble(par = c(1, 2)))
      )
    ), ask = FALSE)
  }  # Then, run the targets pipeline as usual.
}
```
Shorthand to include an R Markdown document in a targets pipeline.

**Arguments**

- **name**: Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and `run set.seed()` on the result to locally recreate the target’s initial RNG state.

- **path**: Character string, file path to the R Markdown source file. Must have length 1.

- **tidy_eval**: Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator `!!` to programmatically insert the values of global objects.

- **packages**: Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.
library  Character vector of library paths to try when loading packages.
error  Character of length 1, what to do if the target stops and throws an error. Options:
  • "stop": the whole pipeline stops and throws an error.
  • "continue": the whole pipeline keeps going.
  • "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
  • "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.
memory  Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.
garbage_collection  Logical, whether to run base::gc() just before the target runs.
deployment  Character of length 1, only relevant to tar_make_cluster() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.
priority  Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).
resources  Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.
retrieval  Character of length 1, only relevant to tar_make_cluster() and tar_make_future(). Must be one of the following values:
  • "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
  • "worker": the worker loads the targets dependencies.
  • "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.
cue  An optional object from tar_cue() to customize the rules that decide whether the target is up to date.
quiet  An option to suppress printing during rendering from knitr, pandoc command line and others. To only suppress printing of the last "Output created: " message, you can set rmarkdown.render.message to FALSE
Named arguments to `rmarkdown::render()`. These arguments are evaluated when the target actually runs in `tar_make()`, not when the target is defined. That means, for example, you can use upstream targets as parameters of parameterized R Markdown reports.

```r
# nolint will run rmarkdown::render("your_report.Rmd", params = list(your_param = your_target)). # nolint For parameterized reports, it is recommended to supply a distinct output_file argument to each `tar_render()` call and set useful defaults for parameters in the R Markdown source. See the examples section for a demonstration.
```

### Details

`tar_render()` is an alternative to `tar_target()` for R Markdown reports that depend on other targets. The R Markdown source should mention dependency targets with `tar_load()` and `tar_read()` in the active code chunks (which also allows you to render the report outside the pipeline if the `_targets/` data store already exists). (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) Then, `tar_render()` defines a special kind of target. It 1. Finds all the `tar_load()`/`tar_read()` dependencies in the report and inserts them into the target’s command. This enforces the proper dependency relationships. (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) 2. Sets `format = "file"` (see `tar_target()`) so targets watches the files at the returned paths and reruns the report if those files change. 3. Configures the target’s command to return both the output report files and the input source file. All these file paths are relative paths so the project stays portable. 4. Forces the report to run in the user’s current working directory instead of the working directory of the report. 5. Sets convenient default options such as `deployment = "main"` in the target and `quiet = TRUE` in `rmarkdown::render()`.

### Value

A target object with `format = "file"`. When this target runs, it returns a character vector of file paths: the rendered document, the source file, and then the *_files/ directory if it exists. Unlike `rmarkdown::render()`, all returned paths are relative paths to ensure portability (so that the project can be moved from one file system to another without invalidating the target). See the "Target objects" section for background.

### Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

Examples

```
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir(  # tar\_dir() runs code from a temporary directory.
    # Unparameterized R Markdown:
    lines <- c(
      "---",
      "title: report.Rmd source file",
      "output_format: html_document",
      "---",
      "Assume these lines are in report.Rmd.",
      "```\{r\}",
      "targets::tar_read(data)",
      "```"
    )
    # Include the report in a pipeline as follows.
    targets::tar_script(
      library(tarchetypes)
      list(
        tar_target(data, data.frame(x = seq_len(26), y = letters)),
        tar_render(report, "report.Rmd")
      ), ask = FALSE)
    # Then, run the targets pipeline as usual.

    # Parameterized R Markdown:
    lines <- c(
      "---",
      "title: 'report.Rmd source file with parameters'",
      "output_format: html_document",
      "params:",
      "  your_param: "default value",
      "---",
      "Assume these lines are in report.Rmd.",
      "```\{r\}",
      "print(params$your_param)",
      "```"
    )
    # Include the report in the pipeline as follows.
    targets::tar_script(
      library(tarchetypes)
      list(
        tar_target(data, data.frame(x = seq_len(26), y = letters)),
        tar_render(report, "report.Rmd", params = list(your_param = data))
      ), ask = FALSE)
  }
  # Then, run the targets pipeline as usual.
```
Description

Shorthand to include an R Markdown document in a targets pipeline (raw version).

Usage

tar_render_raw(
  name,
  path,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  error = targets::tar_option_get("error"),
  deployment = "main",
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue"),
  quiet = TRUE,
  render_arguments = quote(list())
)

Arguments

name Character of length 1, name of the target.
path Character string, file path to the R Markdown source file. Must have length 1.
packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.
library Character vector of library paths to try when loading packages.
error Character of length 1, what to do if the target stops and throws an error. Options:
  • "stop": the whole pipeline stops and throws an error.
  • "continue": the whole pipeline keeps going.
  • "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
  • "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.
deployment Character of length 1, only relevant to tar_make_cluster() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.
priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

retrieval Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target's dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

quiet An option to suppress printing during rendering from knitr, pandoc command line and others. To only suppress printing of the last "Output created: " message, you can set `rmarkdown.render.message` to `FALSE`.

render_arguments Optional language object with a list of named arguments to `rmarkdown::render()`. Cannot be an expression object. (Use `quote()`, not `expression()`.) The reason for quoting is that these arguments may depend on upstream targets whose values are not available at the time the target is defined, and because `tar_render_raw()` is the "raw" version of a function, we want to avoid all non-standard evaluation.

Details

`tar_render_raw()` is just like `tar_render()` except that it uses standard evaluation. The name argument is a character vector, and the `render_arguments` argument is a language object.

Value

A target object with `format = "file"`. When this target runs, it returns a character vector of file paths: the rendered document, the source file, and then the `_files/` directory if it exists. Unlike `rmarkdown::render()`, all returned paths are relative paths to ensure portability (so that the project can be moved from one file system to another without invalidating the target). See the "Target objects" section for background.

Target objects

Most `tarchetypes` functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.
For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    # Unparameterized R Markdown report:
    lines <- c(
      "---",
      "title: 'report.Rmd source file'",
      "output_format: html_document",
      "---",
      "Assume these lines are in report.Rmd.",
      "\"\{r\}",
      "targets::tar_read(data)",
      "\""
    )
    # Include the report in the pipeline as follows:
    targets::tar_script({
      library(tarchetypes)
      list(
        tar_target(data, data.frame(x = seq_len(26), y = letters)),
        tar_render_raw("report", "report.Rmd")
      ), ask = FALSE)
    # Then, run the targets pipeline as usual.
    # Parameterized R Markdown:
    lines <- c(
      "---",
      "title: 'report.Rmd source file with parameters.'",
      "output_format: html_document",
      "params:",
      " your_param: "default value"
      "---",
      "Assume these lines are in report.Rmd.",
      "\"\{r\}",
      "print(params$your_param)",
      "\""
    )
    # Include this parameterized report in the pipeline as follows.
    targets::tar_script({
      library(tarchetypes)
      list(
        tar_target(data, data.frame(x = seq_len(26), y = letters)),
        tar_render_raw("report", "report.Rmd")
```
Parameterized R Markdown with dynamic branching.

Description

Targets to render a parameterized R Markdown report with multiple sets of parameters.

Usage

```r
tar_render_rep(
  name,
  path,
  params = data.frame(),
  batches = NULL,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue"),
  quiet = TRUE,
  ...
)
```

Arguments

- **name**: Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named downstream_target which depends
on a target `upstream_target` and a function `f()`. In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `set.seed()` on the result to locally recreate the target’s initial RNG state.

**path**
Character string, file path to the R Markdown source file. Must have length 1.

**params**
Code to generate a data frame or tibble with one row per rendered report and one column per R Markdown parameter. You may also include an `output_file` column to specify the path of each rendered report. This `params` argument is converted into the command for a target that supplies the R Markdown parameters.

**batches**
Number of batches to group the R Markdown files. For a large number of reports, increase the number of batches to decrease target-level overhead. Defaults to the number of reports to render (1 report per batch).

**packages**
Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

**library**
Character vector of library paths to try when loading packages.

**format**
Optional storage format for the target’s return value. With the exception of `format = "file"`, each target gets a file in `_targets/objects`, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

**iteration**
Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with `vctrs::vec_slice()` and aggregation happens with `vctrs::vec_c()`.
- "list", branching happens with `[]` and aggregation happens with `list()`.
- "group": `dplyr::group_by()`-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with `dplyr::group_by()`.

**error**
Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns `NULL`. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.
memory

Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection

Logical, whether to run base::gc() just before the target runs.

deployment

Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority

Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources

Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

retrieval

Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue

An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

quiet

An option to suppress printing during rendering from knitr, pandoc command line and others. To only suppress printing of the last "Output created: " message, you can set rmarkdown.render.message to FALSE

...

Other named arguments to rmarkdown::render(). Unlike tar_render(), these arguments are evaluated when the target is defined, not when it is run. (The only reason to delay evaluation in tar_render() was to handle R Markdown parameters, and tar_render_rep() handles them differently.)

Details

tar_render_rep() is an alternative to tar_target() for parameterized R Markdown reports that depend on other targets. Parameters must be given as a data frame with one row per rendered report and one column per parameter. An optional output_file column may be included to set the
output file path of each rendered report. The R Markdown source should mention other dependency targets `tar_load()` and `tar_read()` in the active code chunks (which also allows you to render the report outside the pipeline if the _targets/ data store already exists and appropriate defaults are specified for the parameters). (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) Then, `tar_render()` defines a special kind of target. It 1. Finds all the `tar_load()`/`tar_read()` dependencies in the report and inserts them into the target's command. This enforces the proper dependency relationships. (Do not use `tar_load_raw()` or `tar_read_raw()` for this.) 2. Sets format = "file" (see `tar_target()`) so targets watches the files at the returned paths and re-runs the report if those files change. 3. Configures the target's command to return the output report files: the rendered document, the source file, and then the *_files/ directory if it exists. All these file paths are relative paths so the project stays portable. 4. Forces the report to run in the user's current working directory instead of the working directory of the report. 5. Sets convenient default options such as `deployment = "main"` in the target and `quiet = TRUE` in `rmarkdown::render()`.

**Value**

A list of target objects to render the R Markdown reports. Changes to the parameters, source file, dependencies, etc. will cause the appropriate targets to rerun during `tar_make()`. See the "Target objects" section for background.

**Target objects**

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines. For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

**See Also**

Other Literate programming targets: `tar_knit_raw()`, `tar_knit()`, `tar_quarto_raw()`, `tar_quarto_rep_raw()`, `tar_quarto_rep()`, `tar_quarto()`, `tar_render_raw()`, `tar_render_rep_raw()`, `tar_render()`

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    # Parameterized R Markdown:
    lines <- c(
      "---",
      "title: 'report.Rmd file!'",
      "output_format: html_document",
      "params:",
      "  par: '\default value\'",
      "---",
      "Assume these lines are in a file called report.Rmd."
    ),
    # the rest of the target, e.g.
    
  })
```

```
"#'(r)",
"print(params$par)",
"#

# The following pipeline will run the report for each row of params.
targets::tar_script({
  library(tarchetypes)
  list(
    tar_render_rep(
      report,
      "report.Rmd",
      params = tibble::tibble(par = c(1, 2))
    )
  ), ask = FALSE)
# Then, run the targets pipeline as usual.
})
```

tar_render_rep_raw  Parameterized R Markdown with dynamic branching (raw version).

Description

Targets to render a parameterized R Markdown report with multiple sets of parameters (raw version). Same as tar_render_rep() except name is a character string, params is an expression object, and extra arguments to rmarkdown::render() are passed through the args argument instead of ... 

Usage

tar_render_rep_raw(
  name,
  path,
  params = expression(NULL),
  batches = NULL,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue"),
)
quiet = TRUE,
args = list()
)

Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run set.seed() on the result to locally recreate the target’s initial RNG state.

path Character string, file path to the R Markdown source file. Must have length 1.

params Expression object with code to generate a data frame or tibble with one row per rendered report and one column per R Markdown parameter. You may also include an output_file column to specify the path of each rendered report. R Markdown parameters must not be named tar_group or output_file. This params argument is converted into the command for a target that supplies the R Markdown parameters.

batches Number of batches to group the R Markdown files. For a large number of reports, increase the number of batches to decrease target-level overhead. Defaults to the number of reports to render (1 report per batch).

packages Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Character of length 1, format argument to tar_target() to store the data frame of R Markdown parameters.

iteration Character of length 1, iteration argument to tar_target() for the R Markdown documents. Does not apply to the target with R Markdown parameters (whose iteration is always "group").

error Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.
memory
Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection
Logical, whether to run base::gc() just before the target runs.

deployment
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources
Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

retrieval
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue
An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

quiet
An option to suppress printing during rendering from knitr, pandoc command line and others. To only suppress printing of the last "Output created: " message, you can set rmarkdown::render.message to FALSE

args
Named list of other arguments to rmarkdown::render(). Must not include params or output_file. Evaluated when the target is defined.

Details
tar_render_rep_raw() is an alternative to tar_target_raw() for parameterized R Markdown reports that depend on other targets. Parameters must be given as a data frame with one row per rendered report and one column per parameter. An optional output_file column may be included to set the output file path of each rendered report. The R Markdown source should mention other dependency targets tar_load() and tar_read() in the active code chunks (which also allows you to...
render the report outside the pipeline if the _targets/ data store already exists and appropriate de-

faults are specified for the parameters). (Do not use tar_load_raw() or tar_read_raw() for this.)

Then, tar_render() defines a special kind of target. It finds all the tar_load()/tar_read() de-

pendencies in the report and inserts them into the target’s command. This enforces the proper de-

pendency relationships. (Do not use tar_load_raw() or tar_read_raw() for this.)

2. Sets format = "file" (see tar_target()) so targets watches the files at the returned paths and re-

runs the report if those files change. 3. Configures the target’s command to return the output report

files: the rendered document, the source file, and then the *_files/ directory if it exists. All these

file paths are relative paths so the project stays portable. 4. Forces the report to run in the user’s

current working directory instead of the working directory of the report. 5. Sets convenient default

options such as deployment = "main" in the target and quiet = TRUE in rmarkdown::render().

Value

A list of target objects to render the R Markdown reports. Changes to the parameters, source file,

dependencies, etc. will cause the appropriate targets to rerun during tar_make(). See the "Target

objects" section for background.

Target objects

Most tarcthetypes functions are target factories, which means they return target objects or lists

target objects. Target objects represent skippable steps of the analysis pipeline as described

ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis

pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories

explains target factories (functions like this one which generate targets) and the design specifi-

cation at https://books.ropensci.org/targets-design/ details the structure and composition

target objects.

Examples

if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    # Parameterized R Markdown:
    lines <- c(
      "---",
      "title: 'report.Rmd source file'",
      "output_format: html_document",
      "params:",
      "  par: "default value",
      "---",
      "Assume these lines are in a file called report.Rmd.",
      "\"{r}\",
      "print(params$par)"
    ),
```

```
Arguments

name
 Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and `run set.seed()` on the result to locally recreate the target’s initial RNG state.

command
 R code to run multiple times. Must return a list or data frame because `tar_rep()` will try to append new elements/columns `tar_batch` and `tar_rep` to the output to denote the batch and rep-within-batch IDs, respectively.

batches
 Number of batches. This is also the number of dynamic branches created during `tar_make()`.

reps
 Number of replications in each batch. The total number of replications is `batches * reps`.

tidy_eval
 Whether to invoke tidy evaluation (e.g. the `!!` operator from `rlang`) as soon as the target is defined (before `tar_make()`). Applies to the `command` argument.

packages
 Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

library
 Character vector of library paths to try when loading packages.

format
 Optional storage format for the target’s return value. With the exception of `format = "file"`, each target gets a file in `_targets/objects`, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository
 Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of `https://books.ropensci.org/targets/data.html` for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of `https://books.ropensci.org/targets/data.html` for details for instructions.

Note: if `repository` is not "local" and `format` is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration
 Character of length 1, name of the iteration mode of the target. Choices:
• "vector": branching happens with `vectors::vec_slice()` and aggregation happens with `vctrs::vec_c()`.

• "list": branching happens with `[[ ]]` and aggregation happens with `list()`. In the case of list iteration, `tar_read(your_target)` will return a list of lists, where the outer list has one element per batch and each inner list has one element per rep within batch. To un-batch this nested list, call `tar_read(your_target, recursive = FALSE).

• "group": `dplyr::group_by()`-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with `dplyr::group_by()`.

error Character of length 1, what to do if the target stops and throws an error. Options:
• "stop": the whole pipeline stops and throws an error.
• "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)
• "null": The errored target continues and returns `NULL`. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run `base::gc()` just before the target runs.

deployment Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in `tar_make_future()`).

resources Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

storage Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
• "main": the target's return value is sent back to the host machine and saved/uploaded locally.
• "worker": the worker saves/uploads the value.
• "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")'.

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

• "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
• "worker": the worker loads the targets dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from tar_cue() to customize the rules that decide whether the target is up to date.

Details
tar_rep() and tar_rep_raw() each create two targets: an upstream local stem with an integer vector of batch ids, and a downstream pattern that maps over the batch ids. (Thus, each batch is a branch.) Each batch/branch replicates the command a certain number of times. If the command returns a list or data frame, then the targets from tar_rep() will try to append new elements/columns tar_batch and tar_rep to the output to denote the batch and rep-within-batch IDs, respectively.

Both batches and reps within each batch are aggregated according to the method you specify in the iteration argument. If "list", reps and batches are aggregated with list(). If "vector", then vctrs::vec_c(). If "group", then vctrs::vec_rbind().

Value
A list of two targets, one upstream and one downstream. The upstream target returns a numeric index of batch ids, and the downstream one dynamically maps over the batch ids to run the command multiple times. If the command returns a list or data frame, then the targets from tar_rep() will try to append new elements/columns tar_batch and tar_rep to the output to denote the batch and rep-within-batch IDs, respectively. See the "Target objects" section for background.
tar_read(your_target) (on the downstream target with the actual work) will return a list of lists, where the outer list has one element per batch and each inner list has one element per rep within batch. To un-batch this nested list, call tar_read(your_target, recursive = FALSE).

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers,https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      list(tarchetypes::tar_rep(
        x,
        data.frame(x = sample.int(1e4, 2)),
        batches = 2,
        reps = 3
      )
    )
  })
  targets::tar_make()
  targets::tar_read(x)
}
```

---

**tar_rep2**

*Dynamic batched computation downstream of tar_rep()*

**Description**

Batching is important for optimizing the efficiency of heavily dynamically-branched workflows: https://books.ropensci.org/targets/dynamic.html#batching. tar_rep2() uses dynamic branching to iterate over the batches and reps of existing upstream targets.
**Usage**

```r
tar_rep2(
  name,
  command,
  ...
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)
```

**Arguments**

- **name**
  Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target's name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and `run set.seed()` on the result to locally recreate the target's initial RNG state.

- **command**
  R code to run the target.

- **...**
  Symbols to name one or more upstream batched targets created by `tar_rep()`. If you supply more than one such target, all those targets must have the same number of batches and reps per batch. And they must all return either data frames or lists. List targets must use `iteration = "list"` in `tar_rep()`.

- **tidy_eval**
  Logical, whether to enable tidy evaluation when interpreting `command` and `pattern`. If TRUE, you can use the "bang-bang" operator `!!` to programmatically insert the values of global objects.

- **packages**
  Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

- **library**
  Character vector of library paths to try when loading packages.
format  Optional storage format for the target's return value. With the exception of format = "file", each target gets a file in _targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository  Character of length 1, remote repository for target storage. Choices:
- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration  Character of length 1, name of the iteration mode of the target. Choices:
- "vector": branching happens with vctrs::vec_slice() and aggregation happens with vctrs::vec_c().
- "list", branching happens with [[]] and aggregation happens with list().
- "group": dplyr::group_by()-like functionality to branch over subsets of a data frame. The target's return value must be a data frame with a special tar_group column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the tar_group() function to see how you can create the special tar_group column with dplyr::group_by().

error  Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory  Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means
it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection
Logical, whether to run base::gc() just before the target runs.

deployment
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority
Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources
Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

• "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
• "worker": the worker saves/uploads the value.
• "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none").

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

retrieval
Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

• "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
• "worker": the worker loads the targets dependencies.
• "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue
An optional object from tar_cue() to customize the rules that decide whether the target is up to date.
Value

A new target object to perform batched computation. See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      list(        
        tarchetypes::tar_rep(            
          data1,            
          data.frame(value = rnorm(1)),            
          batches = 2,            
          reps = 3        
        ),            
        tarchetypes::tar_rep(            
          data2,            
          list(value = rnorm(1)),            
          batches = 2, reps = 3,            
          iteration = "list" # List iteration is important for batched lists.        
        ),            
        tarchetypes::tar_rep2(            
          aggregate,            
          data.frame(value = data1$value + data2$value),            
          data1,            
          data2        
        )        
      )    
    })
  })
  targets::tar_make()
```
targets::tar_read(aggregate)
})

Batched replication with dynamic branching (raw version).

Description

Batching is important for optimizing the efficiency of heavily dynamically-branched workflows: [https://books.ropensci.org/targets/dynamic.html#batching](https://books.ropensci.org/targets/dynamic.html#batching). `tar_rep_raw()` is just like `tar_rep()` except the name is a character string and the command is a language object.

Usage

```r
tar_rep_raw(
  name,
  command,
  batches = 1,
  reps = 1,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)
```

Arguments

- **name**: Character of length 1, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even
dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with \texttt{tar_meta(your_target, seed)} and run \texttt{set.seed()} on the result to locally recreate the target’s initial RNG state.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>Expression object with code to run multiple times. Must return a list or data frame when evaluated.</td>
</tr>
<tr>
<td>batches</td>
<td>Number of batches. This is also the number of dynamic branches created during \texttt{tar_make()}.</td>
</tr>
<tr>
<td>reps</td>
<td>Number of replications in each batch. The total number of replications is \texttt{batches \ast reps}.</td>
</tr>
<tr>
<td>tidy_eval</td>
<td>Whether to invoke tidy evaluation (e.g. the \texttt{!!} operator from \texttt{rlang}) as soon as the target is defined (before \texttt{tar_make()}). Applies to the command argument.</td>
</tr>
<tr>
<td>packages</td>
<td>Character vector of packages to load right before the target builds or the output data is reloaded for downstream targets. Use \texttt{tar_option_set()} to set packages globally for all subsequent targets you define.</td>
</tr>
<tr>
<td>library</td>
<td>Character vector of library paths to try when loading packages.</td>
</tr>
<tr>
<td>format</td>
<td>Optional storage format for the target’s return value. With the exception of \texttt{format = &quot;file&quot;}, each target gets a file in _targets_objects, and each format is a different way to save and load this file. See the &quot;Storage formats&quot; section for a detailed list of possible data storage formats.</td>
</tr>
<tr>
<td>repository</td>
<td>Character of length 1, remote repository for target storage. Choices:</td>
</tr>
<tr>
<td></td>
<td>- &quot;local&quot;: file system of the local machine.</td>
</tr>
<tr>
<td></td>
<td>- &quot;aws&quot;: Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of \texttt{tar_resources_aws()}, but versioning capabilities may be lost in doing so. See the cloud storage section of \url{<a href="https://books.ropensci.org/targets/data.html%7D">https://books.ropensci.org/targets/data.html}</a> for details for instructions.</td>
</tr>
<tr>
<td></td>
<td>- &quot;gcp&quot;: Google Cloud Platform storage bucket. See the cloud storage section of \url{<a href="https://books.ropensci.org/targets/data.html%7D">https://books.ropensci.org/targets/data.html}</a> for details for instructions.</td>
</tr>
</tbody>
</table>

Note: if \texttt{repository} is not "local" and \texttt{format} is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iteration</td>
<td>Character of length 1, name of the iteration mode of the target. Choices:</td>
</tr>
<tr>
<td></td>
<td>- &quot;vector&quot;: branching happens with \texttt{vctrs::vec_slice()} and aggregation happens with \texttt{vctrs::vec_c()}.</td>
</tr>
<tr>
<td></td>
<td>- &quot;list&quot;: branching happens with \texttt{[]} and aggregation happens with \texttt{list()}.</td>
</tr>
<tr>
<td></td>
<td>- &quot;group&quot;: \texttt{dplyr::group_by()-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special \texttt{tar_group} column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the \texttt{tar_group()} function to see how you can create the special \texttt{tar_group} column with \texttt{dplyr::group_by()}.}</td>
</tr>
<tr>
<td>error</td>
<td>Character of length 1, what to do if the target stops and throws an error. Options:</td>
</tr>
</tbody>
</table>
• "stop": the whole pipeline stops and throws an error.
• "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
• "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:
  • "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
  • "worker": the worker saves/uploads the value.
  • "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").
    If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to tar_path() from inside the target. An example target could look something like tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none").
The distinguishing feature of `storage = "none"` (as opposed to `format = "file"`) is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, `storage = "none"` is completely unnecessary if `format = "file"`.

retrieval Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

Details

tar_rep_raw() creates two targets: an upstream local stem with an integer vector of batch ids, and a downstream pattern that maps over the batch ids. (Thus, each batch is a branch.) Each batch/branch replicates the command a certain number of times.

Both batches and reps within each batch are aggregated according to the method you specify in the iteration argument. If "list", reps and batches are aggregated with `list()`. If "vector", then `vctrs::vec_c()`. If "group", then `vctrs::vec_rbind()`.

Value

A list of two target objects, one upstream and one downstream. The upstream one does some work and returns some file paths, and the downstream target is a pattern that applies `format = "file"`. See the "Target objects" section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      list(
        tarchetypes::tar_rep_raw("x",
          expression(data.frame(x = sample.int(1e4, 2))),
          batches = 2,
          reps = 3
        )
      )
    })
  })
  targets::tar_make(callr_function = NULL)
  targets::tar_read(x)
}
```

tar_select_names

Select target names from a target list

Description

Select the names of targets from a target list.

Usage

```r
tar_select_names(targets, ...)
```

Arguments

- `targets` A list of target objects as described in the "Target objects" section. It does not matter how nested the list is as long as the only leaf nodes are targets.
- `...` One or more comma-separated tidyselect expressions, e.g. `starts_with("prefix")`. Just like `...` in `dplyr::select()`.

Value

A character vector of target names.

Target objects

Most `tarchetypes` functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.
For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**See Also**

Other target selection: `tar_select_targets()`

**Examples**

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets <- list(
      list(
        targets::tar_target(x, 1),
        targets::tar_target(y1, 2)
      ),
      targets::tar_target(y2, 3),
      targets::tar_target(z, 4)
    )
    tar_select_names(targets, starts_with("y"), contains("z"))
  })
}
```

**tar_select_targets**

Select target objects from a target list

**Description**

Select target objects from a target list.

**Usage**

`tar_select_targets(targets, ...)`

**Arguments**

- `targets`: A list of target objects as described in the "Target objects" section. It does not matter how nested the list is as long as the only leaf nodes are targets.
- `...`: One or more comma-separated tidyselect expressions, e.g. `starts_with("prefix")`. Just like `...` in `dplyr::select()`.

**Value**

A list of target objects. See the "Target objects" section of this help file.
Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets <- list(
      list(
        targets::tar_target(x, 1),
        targets::tar_target(y1, 2)
      ),
      targets::tar_target(y2, 3),
      targets::tar_target(z, 4)
    )
  }
  tar_select_targets(targets, starts_with("y"), contains("z"))
}
```

```r
---

**tar_skip**  
*Target with a custom cancellation condition.*

**Description**

Create a target that cancels itself if a user-defined decision rule is met.

**Usage**

```r
tar_skip(
  name,
  command,
  skip,
  tidy_eval = targets::tar_option_get("tidy_eval"),
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  format = targets::tar_option_get("format"),
)```
```
repository = targets::tar_option_get("repository"),
iteration = targets::tar_option_get("iteration"),
error = targets::tar_option_get("error"),
memory = targets::tar_option_get("memory"),
garbage_collection = targets::tar_option_get("garbage_collection"),
deployment = targets::tar_option_get("deployment"),
priority = targets::tar_option_get("priority"),
resources = targets::tar_option_get("resources"),
storage = targets::tar_option_get("storage"),
retrieval = targets::tar_option_get("retrieval"),
cue = targets::tar_option_get("cue")
)

Arguments

name Symbol, name of the target. A target name must be a valid name for a symbol in
R, and it must not start with a dot. Subsequent targets can refer to this name sym-
bolically to induce a dependency relationship: e.g. tar_target(downstream_target,
f(upstream_target)) is a target named downstream_target which depends
on a target upstream_target and a function f(). In addition, a target's name
determines its random number generator seed. In this way, each target runs with
a reproducible seed so someone else running the same pipeline should get the
same results, and no two targets in the same pipeline share the same seed. (Even
dynamic branches have different names and thus different seeds.) You can re-
cover the seed of a completed target with tar_meta(your_target, seed)
and
run set.seed() on the result to locally recreate the target's initial RNG state.

command R code to run the target.

skip R code for the skipping condition. If it evaluates to TRUE during tar_make(),
the target will cancel itself.

tidy_eval Whether to invoke tidy evaluation (e.g. the !! operator from rlang) as soon as
the target is defined (before tar_make()). Applies to arguments command and
skip.

packages Character vector of packages to load right before the target builds or the output
data is reloaded for downstream targets. Use tar_option_set() to set pack-
ages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Optional storage format for the target's return value. With the exception of
format = "file", each target gets a file in _targets/objects, and each format
is a different way to save and load this file. See the "Storage formats" section
for a detailed list of possible data storage formats.

repository Character of length 1, remote repository for target storage. Choices:
  • "local": file system of the local machine.
  • "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a
    non-AWS S3 bucket using the endpoint argument of tar_resources_aws(),
    but versioning capabilities may be lost in doing so. See the cloud stor-
ge section of https://books.ropensci.org/targets/data.html for details for instructions.
• "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration Character of length 1, name of the iteration mode of the target. Choices:

• "vector": branching happens with vctrs::vec_slice() and aggregation happens with vctrs::vec_c().
• "list", branching happens with [[]] and aggregation happens with list().
• "group": dplyr::group_by()-like functionality to branch over subsets of a data frame. The target’s return value must be a data frame with a special tar_group column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the tar_group() function to see how you can create the special tar_group column with dplyr::group_by().

error Character of length 1, what to do if the target stops and throws an error. Options:

• "stop": the whole pipeline stops and throws an error.
• "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)
• "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent” means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). If "worker", the target builds on a parallel worker. If "main", the target builds on the host machine / process managing the pipeline.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get built earlier (and polled earlier in tar_make_future()).
**resources**

Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of `targets`. See `tar_resources()` for details.

**storage**

Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when `retrieval = "none"`).

If you select `storage = "none"`, then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (`format = "file"`) it is the responsibility of the user to write to `tar_path()` from inside the target. An example target could look something like `tar_target(x, saveRDS("value", tar_path(create_dir = TRUE)); "ignored", storage = "none")`.

The distinguishing feature of `storage = "none"` (as opposed to `format = "file"`) is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, `storage = "none"` is completely unnecessary if `format` is "file".

**retrieval**

Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target builds.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

**cue**

An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

**Details**

tar_skip() creates a target that cancels itself whenever a custom condition is met. The mechanism of cancellation is `targets::tar_cancel(your_condition)`, which allows skipping to happen even if the target does not exist yet. This behavior differs from `tar_cue(mode = "never")`, which still runs if the target does not exist.

**Value**

A target object with `targets::tar_cancel(your_condition)` inserted into the command. See the "Target objects" section for background.
Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

See Also

Other targets with custom invalidation rules: tar_change(), tar_download(), tar_force()

Examples

```r
if (identical(Sys.getenv("TAR_LONG_EXAMPLES"), "true")) {
  targets::tar_dir({ # tar_dir() runs code from a temporary directory.
    targets::tar_script({
      list(
        tarchetypes::tar_skip(x, command = "value", skip = 1 > 0)
      )
    })
  })
  targets::tar_make()
}
```

---

### tar_sub

Create multiple expressions with symbol substitution.

Description

Loop over a grid of values and create an expression object from each one. Helps with general metaprogramming.

Usage

```r
tar_sub(expr, values)
```

Arguments

- **expr**: Starting expression. Values are iteratively substituted in place of symbols in expr to create each new expression.
- **values**: List of values to substitute into expr to create the expressions. All elements of values must have the same length.
Value

A list of expression objects. Often, these expression objects evaluate to target objects (but not necessarily). See the “Target objects” section for background.

Target objects

Most tarchetypes functions are target factories, which means they return target objects or lists of target objects. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

See Also

Other Metaprogramming utilities: tar_eval_raw(), tar_eval(), tar_sub_raw()

Examples

```r
# tar_map() is incompatible with tar_render() because the latter
# operates on preexisting tar_target() objects. By contrast,
# tar_eval() and tar_sub() iterate over code farther upstream.
values <- list(
  name = lapply(c("name1", "name2"), as.symbol),
  file = list("file1.Rmd", "file2.Rmd")
)
tar_sub(tar_render(name, file), values = values)
```

**tar_sub_raw**

Create multiple expressions with symbol substitution (raw version).

Description

Loop over a grid of values and create an expression object from each one. Helps with general metaprogramming. Unlike tar_sub(), which quotes the expr argument, tar_sub_raw() assumes expr is an expression object.

Usage

```r
tar_sub_raw(expr, values)
```
Arguments

expr  Expression object with the starting expression. Values are iteratively substituted in place of symbols in expr to create each new expression.
values List of values to substitute into expr to create the expressions. All elements of values must have the same length.

Value

A list of expression objects. Often, these expression objects evaluate to target objects (but not necessarily). See the "Target objects" section for background.
