Package ‘targets’

February 15, 2024

Title  Dynamic Function-Oriented 'Make'-Like Declarative Pipelines

Description  Pipeline tools coordinate the pieces of computationally demanding analysis projects.
The 'targets' package is a 'Make'-like pipeline tool for statistics and data science in R. The package skips costly runtime for tasks that are already up to date, orchestrates the necessary computation with implicit parallel computing, and abstracts files as R objects. If all the current output matches the current upstream code and data, then the whole pipeline is up to date, and the results are more trustworthy than otherwise. The methodology in this package borrows from GNU 'Make' (2015, ISBN:978-9881443519) and 'drake' (2018, <doi:10.21105/joss.00550>).

Description

A pipeline toolkit for Statistics and data science in R, the targets package brings function-oriented programming to Make-like declarative pipelines. targets orchestrates a pipeline as a graph of dependencies, skips steps that are already up to date, runs the necessary computations with optional parallel workers, abstracts files as R objects, and provides tangible evidence that the results are reproducible given the underlying code and data. The methodology in this package borrows from GNU Make (2015, ISBN:978-9881443519) and drake (2018, doi:10.21105/joss.00550).

Other help: tar_reprex(), use_targets(), use_targets_rmd()
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_active() # FALSE
tar_script({
  message("Pipeline running? ", tar_active())
tar_target(x, tar_active())
})
tar_manifest() # prints "Pipeline running? FALSE"
tar_make() # prints "pipeline running? TRUE"
tar_read(x) # TRUE
})
```

---

tar_assert Assertions

**Description**

These functions assert the correctness of user inputs and generate custom error conditions as needed. Useful for writing packages built on top of targets.

**Usage**

- `tar_assert_chr(x, msg = NULL)`
- `tar_assert_dbl(x, msg = NULL)`
- `tar_assert_df(x, msg = NULL)`
- `tar_assert_equal_lengths(x, msg = NULL)`
- `tar_assert_envir(x, msg = NULL)`
- `tar_assert_expr(x, msg = NULL)`
- `tar_assert_flag(x, choices, msg = NULL)`
- `tar_assert_file(x)`
- `tar_assertFinite(x, msg = NULL)`
- `tar_assert_function(x, msg = NULL)`
- `tar_assert_function_arguments(x, args, msg = NULL)`
- `tar_assert_ge(x, threshold, msg = NULL)}`
```
tar_assert_identical(x, y, msg = NULL)
tar_assert_in(x, choices, msg = NULL)
tar_assert_not_dirs(x, msg = NULL)
tar_assert_not_dir(x, msg = NULL)
tar_assert_not_in(x, choices, msg = NULL)
tar_assert_inherits(x, class, msg = NULL)
tar_assert_int(x, msg = NULL)
tar_assert_internet(msg = NULL)
tar_assert_lang(x, msg = NULL)
tar_assert_le(x, threshold, msg = NULL)
tar_assert_list(x, msg = NULL)
tar_assert_lgl(x, msg = NULL)
tar_assert_name(x)
tar_assert_named(x, msg = NULL)
tar_assert_names(x, msg = NULL)
tar_assert_nonempty(x, msg = NULL)
tar_assert_null(x, msg = NULL)
tar_assert_not_expr(x, msg = NULL)
tar_assert_nzchar(x, msg = NULL)
tar_assert_package(package, msg = NULL)
tar_assert_path(path, msg = NULL)
tar_assert_match(x, pattern, msg = NULL)
tar_assert_nonmissing(x, msg = NULL)
tar_assert_positive(x, msg = NULL)
```
tar_assert scalar(x, msg = NULL)

tar_assert store(store)

tar_assert target(x, msg = NULL)

tar_assert target list(x)

tar_assert true(x, msg = NULL)

tar_assert unique(x, msg = NULL)

tar_assert unique targets(x)

Arguments

x
R object, input to be validated. The kind of object depends on the specific assertion function called.

msg
Character of length 1, a message to be printed to the console if x is invalid.

choices
Character vector of choices of x for certain assertions.

args
Character vector of expected function argument names. Order matters.

threshold
Numeric of length 1, lower/upper bound for assertions like tar_assert le()/tar_assert ge().

y
R object, value to compare against x.

class
Character vector of expected class names.

package
Character of length 1, name of an R package.

path
Character, file path.

pattern
Character of length 1, a grep pattern for certain assertions.

store
Character of length 1, path to the data store of the pipeline.

See Also

Other utilities to extend targets: tar_condition, tar_language, tar_test()

Examples

tar_assert_chr("123")
try(tar_assert_chr(123))
**Description**

Configure exponential backoff while polling for tasks during the pipeline.

**Usage**

```
tar_backoff(min = 0.001, max = 0.1, rate = 1.5)
```

**Arguments**

- **min**: Positive numeric of length 1, minimum polling interval in seconds. Must be at least \( \sqrt{\text{Machine}\$\text{double}\$.eps} \).
- **max**: Positive numeric of length 1, maximum polling interval in seconds. Must be at least \( \sqrt{\text{Machine}\$\text{double}\$.eps} \).
- **rate**: Positive numeric of length 1, greater than or equal to 1. Multiplicative rate parameter that allows the exponential backoff minimum polling interval to increase from \( \text{min} \) to \( \text{max} \). Actual polling intervals are sampled uniformly from the current minimum to \( \text{max} \).

**Details**

This function is for advanced usage only. Most users should not need to modify the default exponential backoff. To configure exponential backoff for a pipeline, supply the output of \( \text{tar}\_\text{backoff}() \) to the backoff argument of \( \text{tar}\_\text{option}\_\text{set}() \) in the _targets.R file. See the Backoff section of the help file for details.

**Backoff**

In high-performance computing it can be expensive to repeatedly poll the priority queue if no targets are ready to process. The number of seconds between polls is \( \text{runif}(1, \text{min}, \max(\text{max}, \text{min} * \text{rate} ^ \text{index})) \), where \( \text{index} \) is the number of consecutive polls so far that found no targets ready to skip or run, and \( \text{min}, \text{max}, \text{and rate} \) are arguments to \( \text{tar}\_\text{backoff}() \). (If no target is ready, \( \text{index} \) goes up by 1. If a target is ready, \( \text{index} \) resets to 0. For more information on exponential, backoff, visit [https://en.wikipedia.org/wiki/Exponential_backoff](https://en.wikipedia.org/wiki/Exponential_backoff). Raising \( \text{min} \) or \( \text{max} \) is kinder to the CPU etc. but may incur delays in some instances.

**See Also**

Other utilities: \( \text{tar}\_\text{active}(), \text{tar}\_\text{call}(), \text{tar}\_\text{cancel}(), \text{tar}\_\text{definition}(), \text{tar}\_\text{envir}(), \text{tar}\_\text{group}(), \text{tar}\_\text{name}(), \text{tar}\_\text{path}(), \text{tar}\_\text{path}\_\text{script}(), \text{tar}\_\text{path}\_\text{script}\_\text{support}(), \text{tar}\_\text{path}\_\text{store}(), \text{tar}\_\text{path}\_\text{target}(), \text{tar}\_\text{source}(), \text{tar}\_\text{store}() \)
Examples

```r
tar_branches

Examples
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_option_set(backoff = tar_backoff(min = 0.001, max = 0.1, rate = 1.5))
})
}
```

---

**tar_branches**

*Reconstruct the branch names and the names of their dependencies.*

---

**Description**

Given a branching pattern, use available metadata to reconstruct branch names and the names of each branch’s dependencies. The metadata of each target must already exist and be consistent with the metadata of the other targets involved.

**Usage**

```r
tar_branches(name, pattern, store = targets::tar_config_get("store"))
```

**Arguments**

- `name`  
  Symbol, name of the target.

- `pattern`  
  Language to define branching for a target. For example, in a pipeline with numeric vector targets `x` and `y`, `tar_target(z, x + y, pattern = map(x, y))` implicitly defines branches of `z` that each compute `x[1] + y[1]`, `x[2] + y[2]`, and so on. See the user manual for details.

- `store`  
  Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Details**

The results from this function can help you retroactively figure out correspondences between upstream branches and downstream branches. However, it does not always correctly predict what the names of the branches will be after the next run of the pipeline. Dynamic branching happens while the pipeline is running, so we cannot always know what the names of the branches will be in advance (or even how many there will be).

**Value**

A tibble with one row per branch and one column for each target (including the branched-over targets and the target with the pattern.)
See Also

Other branching: `tar_branch_index()`, `tar_branch_names()`, `tar_branch_names_raw()`, `tar_pattern()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(x, seq_len(2)),
    tar_target(y, head(letters, 2)),
    tar_target(z, head(LETTERS, 2)),
    tar_target(dynamic, c(x, y, z), pattern = cross(z, map(x, y)))
  ), ask = FALSE)
tar_make()
tar_branches(dynamic, pattern = cross(z, map(x, y)))
})
}
```

```
tar_branch_index  Integer branch indexes

Description

Get the integer indexes of individual branch names within their corresponding dynamic branching targets.

Usage

```r
tar_branch_index(names, store = targets::tar_config_get("store"))
```

Arguments

- `names`: Character vector of branch names
- `store`: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

A named integer vector of branch indexes.

See Also

Other branching: `tar_branch_names()`, `tar_branch_names_raw()`, `tar_branches()`, `tar_pattern()`
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      list(
        tar_target(x, seq_len(4)),
        tar_target(y, 2 * x, pattern = map(x)),
        tar_target(z, y, pattern = map(y))
      ), ask = FALSE)
    tar_make()
    names <- c(
      tar_meta(y, children)$children[[1]][c(2, 3)],
      tar_meta(z, children)$children[[1]][2]
    )
    names
    tar_branch_index(names) # c(2, 3, 2)
  })
```

Description

Get the branch names of a dynamic branching target using numeric indexes.

Usage

```r
tar_branch_names(name, index, store = targets::tar_config_get("store"))
```

Arguments

- `name`: Symbol, name of the dynamic branching target (pattern).
- `index`: Integer vector of branch indexes.
- `store`: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

A character vector of branch names.

See Also

Other branching: `tar_branch_index()`, `tar_branch_names_raw()`, `tar_branches()`, `tar_pattern()`
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir(){ # tar_dir() runs code from a temp dir for CRAN.
tar_script(
  list(
    tar_target(x, seq_len(4)),
    tar_target(y, 2 * x, pattern = map(x)),
    tar_target(z, y, pattern = map(y))
  ), ask = FALSE)
tar_make()
tar_branch_names(z, c(2, 3))
})
}
```

---

**tar_branch_names_raw**  Branch names (raw version)

---

Description

Get the branch names of a dynamic branching target using numeric indexes. Same as `tar_branch_names()` except name is a character of length 1.

Usage

```r
tar_branch_names_raw(name, index, store = targets::tar_config_get("store"))
```

Arguments

- **name**: Character of length 1, name of the dynamic branching target (pattern).
- **index**: Integer vector of branch indexes.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

A character vector of branch names.

See Also

Other branching: `tar_branch_index()`, `tar_branch_names()`, `tar_branches()`, `tar_pattern()`
Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
    list(
        tar_target(w, 1),
        tar_target(x, seq_len(4)),
        tar_target(y, 2 * x, pattern = map(x)),
        tar_target(z, y, pattern = map(y))
    ), ask = FALSE)
tar_make()
tar_branch_names_raw("z", c(2, 3))
})
}

---

```r

Identify the called targets function.
```

Description

Get the name of the currently running targets interface function. Returns NULL if not invoked inside a target or _targets.R (i.e. if not directly invoked by tar_make(), tar_visnetwork(), etc.).

Usage

```r
tar_call()
```

Value

Character of length 1, name of the currently running targets interface function. For example, suppose you have a call to tar_call() inside a target or _targets.R. Then if you run tar_make(), tar_call() will return "tar_make".

See Also

Other utilities: tar_active(), tar_backoff(), tar_cancel(), tar_definition(), tar_envir(), tar_group(), tar_name(), tar_path(), tar_path_script(), tar_path_script_support(), tar_path_store(), tar_path_target(), tar_source(), tar_store()

Examples

```r

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
    message("called function: ", tar_call())
    tar_target(x, tar_call())
})
```
\texttt{tar\_cancel}

Cancel a target mid-execution under a custom condition.

\textbf{Description}

Cancel a target while its command is running if a condition is met.

\textbf{Usage}

\texttt{tar\_cancel(condition = TRUE)}

\textbf{Arguments}

- \texttt{condition} Logical of length 1, whether to cancel the target.

\textbf{Details}

Must be invoked by the target itself. \texttt{tar\_cancel()} cannot interrupt a target from another process.

\textbf{See Also}

Other utilities: \texttt{tar\_active()}, \texttt{tar\_backoff()}, \texttt{tar\_call()}, \texttt{tar\_definition()}, \texttt{tar\_envir()}, \texttt{tar\_group()}, \texttt{tar\_name()}, \texttt{tar\_path()}, \texttt{tar\_path\_script()}, \texttt{tar\_path\_script\_support()}, \texttt{tar\_path\_store()}, \texttt{tar\_path\_target()}, \texttt{tar\_source()}, \texttt{tar\_store()}

\textbf{Examples}

\begin{verbatim}
if (identical(Sys.getenv("TAR\_EXAMPLES"), "true")) { # for CRAN
tar\_dir({ # tar\_dir() runs code from a temp dir for CRAN.
tar\_script(tar\_target(x, tar\_cancel(1 > 0)))
tar\_make() # Should cancel target x.
})
}
\end{verbatim}
tar_canceled  List canceled targets.

Description
List targets whose progress is "canceled".

Usage
tar_canceled(names = NULL, store = targets::tar_config_get("store"))

Arguments

names  Optional, names of the targets. If supplied, the function restricts its output to these targets. You can supply symbols or tidyselect helpers like any_of() and starts_with().

store  Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value
A character vector of canceled targets.

See Also
Other progress: tar_completed(), tar_dispatched(), tar_errored(), tar_poll(), tar_progress(), tar_progress_branches(), tar_progress_summary(), tar_skipped(), tar_watch(), tar_watch_server(), tar_watch_ui()

Examples
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(x, seq_len(2)),
    tar_target(y, 2 * x, pattern = map(x))
  ),
  ask = FALSE
})
tar_make()
tar_canceled()
tar_canceled(starts_with("y_")) # see also any_of()
})
}
**Description**

List targets whose progress is "completed".

**Usage**

```
tar_completed(names = NULL, store = targets::tar_config_get("store"))
```

**Arguments**

- `names`: Optional, names of the targets. If supplied, the function restricts its output to these targets. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`.
- `store`: Character of length 1, path to the `targets` data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

A character vector of completed targets.

**See Also**

Other progress: `tar_canceled()`, `tar_dispatched()`, `tar_erored()`, `tar_poll()`, `tar_progress()`, `tar_progress_branches()`, `tar_progress_summary()`, `tar_skipped()`, `tar_watch()`, `tar_watch_server()`, `tar_watch_ui()`

**Examples**

```
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
      ),
      ask = FALSE)
    });
    tar_make()
    tar_completed()
    tar_completed(starts_with("y")) # see also any_of()
  })
}
```
These functions throw custom targets-specific error conditions. Useful for error handling in packages built on top of targets.

Usage

```
tar_message_run(...)
tar_throw_file(...)
tar_throw_run(..., class = character(0))
tar_throw_validate(...)
tar_warn_deprecate(...)
tar_warn_run(...)
tar_warn_validate(...)
tar_message_validate(...)
tar_print(...)
tar_error(message, class)
tar_warning(message, class)
tar_message(message, class)
```

Arguments

- `...`: zero or more objects which can be coerced to character (and which are pasted together with no separator) or a single condition object.
- `class`: Character vector of S3 classes of the message.
- `message`: Character of length 1, text of the message.

See Also

Other utilities to extend targets: `tar_assert`, `tar_language`, `tar_test()`
Examples

```r
try(tar_throw_validate("something is not valid"))
```

---

### Description

Read the custom settings for the current project in the optional YAML configuration file.

#### Usage

```r
tar_config_get(
  name,
  config = Sys.getenv("TAR_CONFIG", "_targets.yaml"),
  project = Sys.getenv("TAR_PROJECT", "main")
)
```

#### Arguments

- **name**
  - Character of length 1, name of the specific configuration setting to retrieve.

- **config**
  - Character of length 1, file path of the YAML configuration file with targets project settings. The config argument specifies which YAML configuration file that `tar_config_get()` reads from or `tar_config_set()` writes to in a single function call. It does not globally change which configuration file is used in subsequent function calls. The default file path of the YAML file is always `_targets.yaml` unless you set another default path using the TAR_CONFIG environment variable, e.g. `Sys.setenv(TAR_CONFIG = "custom.yaml")`. This also has the effect of temporarily modifying the default arguments to other functions such as `tar_make()` because the default arguments to those functions are controlled by `tar_config_get()`.

- **project**
  - Character of length 1, name of the current targets project. Thanks to the config R package, targets YAML configuration files can store multiple sets of configuration settings, with each set corresponding to its own project. The project argument allows you to set or get a configuration setting for a specific project for a given call to `tar_config_set()` or `tar_config_get()`. The default project is always called "main" unless you set another default project using the TAR_PROJECT environment variable, e.g. `Sys.setenv(tar_project = "custom")`. This also has the effect of temporarily modifying the default arguments to other functions such as `tar_make()` because the default arguments to those functions are controlled by `tar_config_get()`.

#### Value

The value of the configuration setting from the YAML configuration file (default: `_targets.yaml`) or the default value if the setting is not available. The data type of the return value depends on your choice of name.
Storage access

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as `tar_render()` and `tar_quarto()`.

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as `tar_render()` and `tar_quarto()`.

Configuration

For several key functions like `tar_make()`, the default values of arguments are controlled though `tar_config_get()`. `tar_config_get()` retrieves data from an optional YAML configuration file. You can control the settings in the YAML file programatically with `tar_config_set()`. The default file path of this YAML file is `_targets.yaml`, and you can set another path globally using the `TAR_CONFIG` environment variable. The YAML file can store configuration settings for multiple projects, and you can globally set the default project with the `TAR_PROJECT` environment variable. The structure of the YAML file follows rules similar to the `config` R package, e.g. projects can inherit settings from one another using the `inherits` field. Exceptions include:

1. There is no requirement to have a configuration named "default".
2. Other projects do not inherit from the default project automatically.
3. Not all fields need values because `targets` already has defaults.

targets does not actually invoke the `config` package. The implementation in targets was written from scratch without viewing or copying any part of the source code of config.

See Also

Other configuration: `tar_config_projects()`, `tar_config_set()`, `tar_config_unset()`, `tar_config_yaml()`, `tar_envvars()`, `tar_option_get()`, `tar_option_reset()`, `tar_option_set()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(list(tar_target(x, 1 + 1)))
tar_config.get("store") # "_targets"
store_path <- tempfile()
tar_config.set(store = store_path)
tar_config.get("store") # Shows a temp file.
tar_make() # Writes to the custom data store identified in _targets.yaml.
tar_read(x) # tar_read() knows about _targets.yaml too.
file.exists("_targets") # FALSE
```
Description

List the names of projects defined in _targets.yaml.

Usage

tar_config_projects(config = Sys.getenv("TAR_CONFIG", "_targets.yaml"))

Arguments

config  Character of length 1, file path of the YAML configuration file with targets project settings. The config argument specifies which YAML configuration file that tar_config_get() reads from or tar_config_set() writes to in a single function call. It does not globally change which configuration file is used in subsequent function calls. The default file path of the YAML file is always _targets.yaml unless you set another default path using the TAR_CONFIG environment variable, e.g. Sys.setenv(TAR_CONFIG = "custom.yaml"). This also has the effect of temporarily modifying the default arguments to other functions such as tar_make() because the default arguments to those functions are controlled by tar_config_get().

Value

Character vector of names of projects defined in _targets.yaml.

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

Other configuration: `tar_config_get()`, `tar_config_set()`, `tar_config_unset()`, `tar_config_yaml()`, `tar_envvars()`, `tar_option_get()`, `tar_option_reset()`, `tar_option_set()`

Examples

```r
yaml <- tempfile()
tar_config_set(store = "my_store_a", config = yaml, project = "project_a")
tar_config_set(store = "my_store_b", config = yaml, project = "project_b")
tar_config_projects(config = yaml)
```

```
tar_config_set  Set configuration settings.
```

Description

tar_config_set() writes special custom settings for the current project to an optional YAML configuration file.

Usage

tar_config_set(
  inherits = NULL,
  as_job = NULL,
  garbage_collection = NULL,
  label = NULL,
  level_separation = NULL,
  reporter_make = NULL,
  reporter_outdated = NULL,
)
script = NULL,
seconds_meta_append = NULL,
seconds_meta_upload = NULL,
seconds_reporter = NULL,
seconds_interval = NULL,
store = NULL,
shortcut = NULL,
use_crew = NULL,
workers = NULL,
config = Sys.getenv("TAR_CONFIG", ".targets.yaml"),
project = Sys.getenv("TAR_PROJECT", "main")
)

Arguments

inherits  Character of length 1, name of the project from which the current project should inherit configuration settings. The current project is the project argument, which defaults to Sys.getenv("TAR_PROJECT", "main"). If the inherits argument NULL, the inherits setting is not modified. Use tar_config_unset() to delete a setting.

as_job   Logical of length 1, as_job argument of tar_make(). TRUE to run as an RStudio IDE / Posit Workbench job, FALSE to run as a callr process in the main R session (depending on the callr_function argument). If as_job_ is TRUE, then the rstudioapi package must be installed.

garbage_collection Logical of length 1, garbage_collection argument of tar_make() (if crew is enabled), tar_make_clustermq(), and tar_make_future(). Whether to run garbage collection on the main process before sending a target to a worker. For tar_make(), this argument is ignored if tar_option_get("controller") is NULL. Independent from the garbage_collection argument of tar_target(), which controls garbage collection on the worker.

label     Argument of tar_visnetwork() to control node labels.

level_separation Argument of tar_visnetwork() and tar_glimpse() to control the space between hierarchical levels.

reporter_make Character of length 1, reporter argument to tar_make() and related functions that run the pipeline. If the argument NULL, the setting is not modified. Use tar_config_unset() to delete a setting.

reporter_outdated Character of length 1, reporter argument to tar_outdated() and related functions that do not run the pipeline. If the argument NULL, the setting is not modified. Use tar_config_unset() to delete a setting.

script    Character of length 1, path to the target script file that defines the pipeline (_targets.R by default). This path should be either an absolute path or a path relative to the project root where you will call tar_make() and other functions. When tar_make() and friends run the script from the current working directory. If the argument NULL, the setting is not modified. Use tar_config_unset() to delete a setting.
seconds_meta_append
Argument of \texttt{tar_make()}, \texttt{tar_make_clustermq()}, and \texttt{tar_make_future()}. Positive numeric of length 1 with the minimum number of seconds between saves to the local metadata and progress files in the data store. Higher values generally make the pipeline run faster, but unsaved work (in the event of a crash) is not up to date. When the pipeline ends, all the metadata and progress data is saved immediately, regardless of \texttt{seconds_meta_append}.

seconds_meta_upload
Argument of \texttt{tar_make()}, \texttt{tar_make_clustermq()}, and \texttt{tar_make_future()}. Positive numeric of length 1 with the minimum number of seconds between uploads of the metadata and progress data to the cloud (see \url{https://books.ropensci.org/targets/cloud-storage.html}). Higher values generally make the pipeline run faster, but unsaved work (in the event of a crash) may not be backed up to the cloud. When the pipeline ends, all the metadata and progress data is uploaded immediately, regardless of \texttt{seconds_meta_upload}.

seconds_reporter
Argument of \texttt{tar_make()}, \texttt{tar_make_clustermq()}, and \texttt{tar_make_future()}. Positive numeric of length 1 with the minimum number of seconds between times when the reporter prints progress messages to the R console.

seconds_interval
Deprecated on 2023-08-24 (version 1.2.2.9001). Use \texttt{seconds_meta_append}, \texttt{seconds_meta_upload}, and \texttt{seconds_reporter} instead.

store
Character of length 1, path to the data store of the pipeline. If NULL, the store setting is left unchanged in the YAML configuration file (default: \_targets\_yaml). Usually, the data store lives at \_targets. Set store to a custom directory to specify a path other than \_targets\/. The path need not exist before the pipeline begins, and it need not end with \_targets, but it must be writeable. For optimal performance, choose a storage location with fast read/write access. If the argument NULL, the setting is not modified. Use \texttt{tar_config_unset()} to delete a setting.

shortcut
Logical of length 1, default shortcut argument to \texttt{tar_make()} and related functions. If the argument NULL, the setting is not modified. Use \texttt{tar_config_unset()} to delete a setting.

use_crew
Logical of length 1, whether to use crew in \texttt{tar_make()} if the controller option is set in \texttt{target_option_set()} in the target script (\_targets.R). See \url{https://books.ropensci.org/targets/crew.html} for details.

workers
Positive numeric of length 1, workers argument of \texttt{tar_make_clustermq()} and related functions that run the pipeline with parallel computing among targets. If the argument NULL, the setting is not modified. Use \texttt{tar_config_unset()} to delete a setting.

config
Character of length 1, file path of the YAML configuration file with targets project settings. The config argument specifies which YAML configuration file that \texttt{tar_config_get()} reads from or \texttt{tar_config_set()} writes to in a single function call. It does not globally change which configuration file is used in subsequent function calls. The default file path of the YAML file is always \_targets\_yaml unless you set another default path using the TAR_CONFIG environment variable, e.g. \texttt{Sys.setenv(TAR_CONFIG = "custom\_yaml")}. This also
has the effect of temporarily modifying the default arguments to other functions such as `tar_make()` because the default arguments to those functions are controlled by `tar_config_get()`.

**project**

Character of length 1, name of the current targets project. Thanks to the `config` R package, targets YAML configuration files can store multiple sets of configuration settings, with each set corresponding to its own project. The `project` argument allows you to set or get a configuration setting for a specific project for a given call to `tar_config_set()` or `tar_config_get()`. The default project is always called "main" unless you set another default project using the `TAR_PROJECT` environment variable, e.g. `Sys.setenv(tar_project = "custom")`. This also has the effect of temporarily modifying the default arguments to other functions such as `tar_make()` because the default arguments to those functions are controlled by `tar_config_get()`.

**Value**

NULL (invisibly)

**Configuration**

For several key functions like `tar_make()`, the default values of arguments are controlled though `tar_config_get()`. `tar_config_get()` retrieves data from an optional YAML configuration file. You can control the settings in the YAML file programmatically with `tar_config_set()`. The default file path of this YAML file is `_targets.yaml`, and you can set another path globally using the `TAR_CONFIG` environment variable. Other configuration: \code{tar\_config\_get()}, \code{tar\_config\_projects()}, \code{tar\_config\_unset()}, \code{tar\_config\_yaml()}, \code{tar\_envvars()}, \code{tar\_option\_get()}, \code{tar\_option\_reset()}, \code{tar\_option\_set()}

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  tar\_dir({ # tar\_dir() runs code from a temp dir for CRAN.
    tar\_script(list(tar\_target(x, 1 + 1)))
    tar\_config\_get("store") # NULL (data store defaults to "/targets/"
    store\_path <- tempfile()
    tar\_config\_set(store = store\_path)
    tar\_config\_get("store") # Shows a temp file.
    tar\_make() # Writes to the custom data store identified in "/targets.yaml".
    tar\_read(x) # tar\_read() knows about "/targets.yaml" too.
    file\_exists("_targets") # FALSE
    file\_exists(store\_path) # TRUE
  })
}
```

**Description**

Unset (i.e. delete) one or more custom settings for the current project from the optional YAML configuration file. After that, \code{tar\_option\_get()} will return the original default values for those settings for the project.

**Usage**

```r
tar\_config\_unset(
  names = character(0),
  config = Sys.getenv("TAR\_CONFIG", ".targets.yaml"),
  project = Sys.getenv("TAR\_PROJECT", "main")
)
```

**Arguments**

- **names**: Character vector of configuration settings to delete from the current project.
- **config**: Character of length 1, file path of the YAML configuration file with targets project settings. The config argument specifies which YAML configuration file that \code{tar\_config\_get()} reads from or \code{tar\_config\_set()} writes to in a single function call.     tar_config_get("store")  # _targets
  })
}
```

---

tar_config_yaml

Read _targets.yaml.

Description

Read the YAML content of _targets.yaml.

Usage

```r
tar_config_yaml(config = Sys.getenv("TAR_CONFIG", ".targets.yaml"))
```

Arguments

- **config**: Character of length 1, file path of the YAML configuration file with targets project settings. The config argument specifies which YAML configuration file that tar_config_get() reads from or tar_config_set() writes to in a single function call. It does not globally change which configuration file is used in subsequent function calls. The default file path of the YAML file is always _targets.yaml unless you set another default path using the TAR_CONFIG environment variable, e.g. Sys.setenv(TAR_CONFIG = "custom.yaml"). This also has the effect of temporarily modifying the default arguments to other functions such as tar_make() because the default arguments to those functions are controlled by tar_config_get().
Value

Nested list of fields defined in _targets.yaml.

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

Other configuration: tar_config_get(), tar_config_projects(), tar_config_set(), tar_config_unset(), tar_envvars(), tar_option_get(), tar_option_reset(), tar_option_set()

Examples

yaml <- tempfile()
tar_config_set(store = "my_store_a", config = yaml, project = "project_a")
tar_config_set(store = "my_store_b", config = yaml, project = "project_b")
str(tar_config_yaml(config = yaml))
tar_crew

**Get crew worker info.**

**Description**

For the most recent run of the pipeline with `tar_make()` where a crew controller was started, get summary-level information of the workers.

**Usage**

```r
tar_crew(store = targets::tar_config_get("store"))
```

**Arguments**

| store | Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project. |

**Value**

A data frame one row per crew worker and the following columns:

- controller: name of the crew controller.
- launches: number of times the worker was launched.
- seconds: number of seconds the worker spent running tasks.
- targets: number of targets the worker completed and delivered.

**Storage access**

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarcheetypes package such as `tar_render()` and `tar_quarto()`.

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. **See Also**

Other data: `tar_load()`, `tar_load_everything()`, `tar_load_raw()`, `tar_objects()`, `tar_pid()`, `tar_process()`, `tar_read()`, `tar_read_raw()`
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
if (requireNamespace("crew", quietly = TRUE)) {
  tar_script({
    tar_option_set(controller = crew::crew_controller_local())
    list(
      tar_target(x, seq_len(2)),
      tar_target(y, 2 * x, pattern = map(x))
    ), ask = FALSE)
  tar_make()
  tar_process()
  tar_process(pid)
} }
}
```

---

**tar_cue**

*Declare the rules that cue a target.*

Description

Declare the rules that mark a target as outdated.

Usage

```r
tar_cue(
  mode = c("thorough", "always", "never"),
  command = TRUE,
  depend = TRUE,
  format = TRUE,
  repository = TRUE,
  iteration = TRUE,
  file = TRUE,
  seed = TRUE
)
```

Arguments

- **mode**
  - Cue mode. If "thorough", all the cues apply unless individually suppressed. If "always", then the target always runs. If "never", then the target does not run unless the metadata does not exist or the last run errored.

- **command**
  - Logical, whether to rerun the target if command changed since last time.

- **depend**
  - Logical, whether to rerun the target if the value of one of the dependencies changed.
format Logical, whether to rerun the target if the user-specified storage format changed. The storage format is user-specified through `tar_target()` or `tar_option_set()`.

repository Logical, whether to rerun the target if the user-specified storage repository changed. The storage repository is user-specified through `tar_target()` or `tar_option_set()`.

iteration Logical, whether to rerun the target if the user-specified iteration method changed. The iteration method is user-specified through `tar_target()` or `tar_option_set()`.

file Logical, whether to rerun the target if the file(s) with the return value changed or at least one is missing.

seed Logical, whether to rerun the target if pseudo-random number generator seed either changed or is `NA`. The reproducible deterministic target-specific seeds are controlled by `tar_option_get("seed")` and the target names. See `tar_option_set()` for details.

**Target invalidation rules**

Targets uses internal metadata and special cues to decide whether a target is up to date (can skip) or is outdated/invalidated (needs to rerun). By default, targets moves through the following list of cues and declares a target outdated if at least one is cue activated.

1. There is no metadata record of the target.
2. The target errored last run.
3. The target has a different class than it did before.
4. The cue mode equals "always".
5. The cue mode does not equal "never".
6. The `command` metadata field (the hash of the R command) is different from last time.
7. The `depend` metadata field (the hash of the immediate upstream dependency targets and global objects) is different from last time.
8. The storage format is different from last time.
9. The iteration mode is different from last time.
10. A target's file (either the one in `_targets/objects/` or a dynamic file) does not exist or changed since last time.

The user can suppress many of the above cues using the `tar_cue()` function, which creates the cue argument of `tar_target()`. Cues objects also constitute more nuanced target invalidation rules. The tarchetypes package has many such examples, including `tar_age()`, `tar_download()`, `tar_cue_age()`, `tar_cue_force()`, and `tar_cue_skip()`.

**Dependency-based invalidation and user-defined functions**

If the cue of a target has `depend = TRUE` (default) then the target is marked invalidated/outdated when its upstream dependencies change. A target’s dependencies include upstream targets, user-defined functions, and other global objects populated in the target script file (default: `_targets.R`). To determine if a given dependency changed since the last run of the pipeline, targets computes hashes. The hash of a target is computed on its files in storage (usually a file in `_targets/objects/`). The hash of a non-function global object dependency is computed directly on its in-memory data. User-defined functions are hashed in the following way:
1. Deparse the function with `targets::tar_deparse_safe()`. This function computes a string representation of the function body and arguments. This string representation is invariant to changes in comments and whitespace, which means trivial changes to formatting do not cue targets to rerun.

2. Manually remove any literal pointers from the function string using `targets::mask_pointers()`. Such pointers arise from inline compiled C/C++ functions.

3. Using static code analysis (i.e. `tar_deps()`, which is based on `codetools::findGlobals()`) identify any user-defined functions and global objects that the current function depends on. Append the hashes of those dependencies to the string representation of the current function.

4. Compute the hash of the final string representation using `targets::digest_chr64()`.

Above, (3) is important because user-defined functions have dependencies of their own, such as other user-defined functions and other global objects. (3) ensures that a change to a function’s dependencies invalidates the function itself, which in turn invalidates any calling functions and any targets downstream with the `depend` cue turned on.

**See Also**

Other targets: `tar_format()`, `tar_target()`, `tar_target_raw()`

**Examples**

```r
# The following target will always run when the pipeline runs.
x <- tar_target(x, download_data(), cue = tar_cue(mode = "always"))
```

**tar_definition**

*For developers only: get the definition of the current target.*

**Description**

For developers only: get the full definition of the target currently running. This target definition is the same kind of object produced by `tar_target()`.

**Usage**

```r
tar_definition(
    default = targets::tar_target_raw("target_name", quote(identity())))
)
```

**Arguments**

`default` Environment, value to return if `tar_definition()` is called on its own outside a `targets` pipeline. Having a default lets users run things without `tar_make()`, which helps peel back layers of code and troubleshoot bugs.
Details

Most users should not use `tar_definition()` because accidental modifications could break the pipeline. `tar_definition()` only exists in order to support third-party interface packages, and even then the returned target definition is not modified.

Value

If called from a running target, `tar_definition()` returns the target object of the currently running target. See the "Target objects" section for details.

Target objects

Functions like `tar_target()` produce target objects, special objects with specialized sets of S3 classes. Target objects represent skippable steps of the analysis pipeline as described at https://books.ropensci.org/targets/. Please read the walkthrough at https://books.ropensci.org/targets/walkthrough.html to understand the role of target objects in analysis pipelines.

For developers, https://wlandau.github.io/targetopia/contributing.html#target-factories explains target factories (functions like this one which generate targets) and the design specification at https://books.ropensci.org/targets-design/ details the structure and composition of target objects.

See Also

Other utilities: `tar_active()`, `tar_backoff()`, `tar_call()`, `tar_cancel()`, `tar_envir()`, `tar_group()`, `tar_name()`, `tar_path()`, `tar_path_script()`, `tar_path_script_support()`, `tar_path_store()`, `tar_path_target()`, `tar_source()`, `tar_store()`

Examples

```r
class(tar_definition())
tar_definition()$settings$name
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(
  tar_target(x, tar_definition()$settings$memory, memory = "transient")
)
tar_make(x)
tar_read(x)
})
```

Description

Delete the output values of targets in _targets/objects/ (or the cloud if applicable) but keep the records in the metadata.
Usage

```r
tar_delete(
  names,
  cloud = TRUE,
  batch_size = 1000L,
  verbose = TRUE,
  store = targets::tar_config_get("store")
)
```

Arguments

- **names**: Names of the targets to remove from `_targets/objects/`. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`.
- **cloud**: Logical of length 1, whether to delete objects from the cloud if applicable (e.g. AWS, GCP). If FALSE, files are not deleted from the cloud.
- **batch_size**: Positive integer between 1 and 1000, number of target objects to delete from the cloud with each HTTP API request. Currently only supported for AWS. Cannot be more than 1000.
- **verbose**: Logical of length 1, whether to print console messages to show progress when deleting each batch of targets from each cloud bucket. Batched deletion with verbosity is currently only supported for AWS.
- **store**: Character of length 1, path to the `targets` data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

If you have a small number of data-heavy targets you need to discard to conserve storage, this function can help. Local external files files (i.e. `format = "file"` and `repository = "local"`) are not deleted. For targets with `repository` not equal "local", `tar_delete()` attempts to delete the file and errors out if the deletion is unsuccessful. If deletion fails, either log into the cloud platform and manually delete the file (e.g. the AWS web console in the case of `repository = "aws"`) or call `tar_invalidate()` on that target so that `targets` does not try to delete the object. For patterns recorded in the metadata, all the branches will be deleted. For patterns no longer in the metadata, branches are left alone.

Storage access

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

### Cloud target data versioning

Some buckets in Amazon S3 or Google Cloud Storage are "versioned", which means they track historical versions of each data object. If you use targets with cloud storage ([https://books.ropensci.org/targets/cloud-storage.html](https://books.ropensci.org/targets/cloud-storage.html)) and versioning is turned on, then targets will record each version of each target in its metadata.

Functions like `tar_read()` and `tar_load()` load the version recorded in the local metadata, which may not be the same as the "current" version of the object in the bucket. Likewise, functions `tar_delete()` and `tar_destroy()` only remove the version ID of each target as recorded in the local metadata.

If you want to interact with the *latest* version of an object instead of the version ID recorded in the local metadata, then you will need to delete the object from the metadata.

1. Make sure your local copy of the metadata is current and up to date. You may need to run `tar_meta_download()` or `tar_meta_sync()` first.
2. Run `tar_unversion()` to remove the recorded version IDs of your targets in the local metadata.
3. With the version IDs gone from the local metadata, functions like `tar_read()` and `tar_destroy()` will use the *latest* version of each target data object.
4. Optional: to back up the local metadata file with the version IDs deleted, use `tar_meta_upload()`.

#### See Also

Other clean: `tar_destroy()`, `tar_invalidate()`, `tar_prune()`, `tar_prune_list()`, `tar_unversion()`

#### Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(y1, 1 + 1),
    tar_target(y2, 1 + 1),
    tar_target(z, y1 + y2)
  )
}, ask = FALSE)
tar_make()
tar_delete(starts_with("y")) # Only deletes y1 and y2.
tar_make() # y1 and y2 rerun but return the same values, so z is up to date.
})
}
```
tar_deps

---

**Description**

List the dependencies of a function or expression.

**Usage**

```r
tar_deps(expr)
```

**Arguments**

- `expr` A quoted R expression or function.

**Details**

targets detects the dependencies of commands using static code analysis. Use `tar_deps()` to run the code analysis and see the dependencies for yourself.

**Value**

Character vector of the dependencies of a function or expression.

**See Also**

`tar_branches()`, `tar_network()`

Other inspect: `tar_deps_raw()`, `tar_manifest()`, `tar_network()`, `tar_outdated()`, `tar_sitrep()`, `tar_validate()`

**Examples**

```r
tar_deps(x <- y + z)
tar_deps({
  x <- 1
  x + a
})
tar_deps(function(a = b) map_dfr(data, ~do_row(.x)))
```
### tar_deps_raw

**Code dependencies (raw version)**

#### Description

Same as `tar_deps()` except `expr` must already be an unquoted function or expression object.

#### Usage

```r
.tar_deps_raw(expr)
```

#### Arguments

- `expr`  
  An R expression object or function.

#### Value

Character vector of the dependencies of a function or expression.

#### See Also

Other inspect: `tar_deps()`, `tar_manifest()`, `tar_network()`, `tar_outdated()`, `tar_sitrep()`, `tar_validate()`

#### Examples

```r
tar_deps_raw(quote(x <- y + z))
tar_deps_raw(quote({
        x <- 1
        x + a
    }))
tar_deps_raw(function(a = b) map_dfr(data, ~do_row(.x)))
```

---

### tar_destroy

**Destroy the data store.**

#### Description

Destroy the data store written by the pipeline.
Usage

```r
tar_destroy(
  destroy = c("all", "cloud", "local", "meta", "process", "progress", "objects",
             "scratch", "workspaces", "user"),
  batch_size = 1000L,
  verbose = TRUE,
  ask = NULL,
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```

Arguments

- **destroy** Character of length 1, what to destroy. Choices:
  - "all": entire data store (default: _targets/) including cloud data, as well as download/upload scratch files.
  - "cloud": cloud data, including metadata as well as target object data from targets with `tar_target(..., repository = "aws")`. Also deletes temporary staging files in `file.path(tempdir(), "targets")` that may have been accidentally left over from incomplete uploads or downloads.
  - "local": all the local files in the data store but nothing on the cloud.
  - "meta": metadata file at `meta/meta` in the data store, which invalidates all the targets but keeps the data.
  - "process": progress data file at `meta/process` in the data store, which resets the metadata of the main process.
  - "progress": progress data file at `meta/progress` in the data store, which resets the progress tracking info.
  - "objects": all the target return values in `objects/` in the data store but keep progress and metadata. Dynamic files are not deleted this way.
  - "scratch": temporary files in saved during `tar_make()` that should automatically get deleted except if R crashed.
  - "workspaces": compressed lightweight files in `workspaces/` in the data store with the saved workspaces of targets. See `tar_workspace()` for details.
  - "user": custom user-supplied files in the `user/` folder in the data store.

- **batch_size** Positive integer between 1 and 1000, number of target objects to delete from the cloud with each HTTP API request. Currently only supported for AWS. Cannot be more than 1000.

- **verbose** Logical of length 1, whether to print console messages to show progress when deleting each batch of targets from each cloud bucket. Batched deletion with verbosity is currently only supported for AWS.

- **ask** Logical of length 1, whether to pause with a menu prompt before deleting files. To disable this menu, set the TAR_ASK environment variable to "false". `usethis::edit_r_environ()` can help set environment variables.
**tar_destroy**

- **script**: Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. If the script does not exist, then cloud metadata will not be deleted.

- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Details**

The data store is a folder created by `tar_make()` (or `tar_make_future()` or `tar_make_clustermq()`). The details of the data store are explained at [https://books.ropensci.org/targets/data.html#local-data-store](https://books.ropensci.org/targets/data.html#local-data-store). The data store folder contains the output data and metadata of the targets in the pipeline. Usually, the data store is a folder called `_targets/` (see `tar_config_set()` to customize), and it may link to data on the cloud if you used AWS or GCP buckets. By default, `tar_destroy()` deletes the entire `_targets/` folder (or wherever the data store is located), including custom user-supplied files in `_targets/user/`, as well as any cloud data that the pipeline uploaded. See the `destroy` argument to customize this behavior and only delete part of the data store, and see functions like `tar_invalidate()`, `tar_delete()`, and `tar_prune()` to remove information pertaining to some but not all targets in the pipeline. After calling `tar_destroy()` with default arguments, the entire data store is gone, which means all the output data from previous runs of the pipeline is gone (except for input/output files tracked with `tar_target(..., format = "file")`). The next run of the pipeline will start from scratch, and it will not skip any targets.

**Value**

`NULL` (invisibly).

**Storage access**

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

**See Also**

Other clean: `tar_delete()`, `tar_invalidate()`, `tar_prune()`, `tar_prune_list()`, `tar_unversion()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir( # tar_dir() runs code from a temp dir for CRAN.
tar_script(list(tar_target(x, 1 + 1)), ask = FALSE)
tar_make() # Creates the _targets/ data store.
tar_destroy()
print(file.exists("_targets")) # Should be FALSE.
}
```

---

**tar_dispatched**

List dispatched targets.

**Description**

List the targets with progress status "dispatched".

**Usage**

```r
tar_dispatched(names = NULL, store = targets::tar_config_get("store"))
```
Arguments

names  Optional, names of the targets. If supplied, the function restricts its output to these targets. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`.

store  Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

A target is "dispatched" if it is sent off to be run. Depending on your high-performance computing configuration via the crew package, the may not actually start right away. This may happen if the target is ready to start but all available parallel workers are busy.

Value

A character vector of dispatched targets.

See Also

Other progress: `tar_canceled()`, `tar_completed()`, `tar_errored()`, `tar_poll()`, `tar_progress()`, `tar_progress_branches()`, `tar_progress_summary()`, `tar_skipped()`, `tar_watch()`, `tar_watch_server()`, `tar_watch_ui()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {  # for CRAN
tar_dir({  # tar_dir() runs code from a temp dir for CRAN.
tar_script({
    list(
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
    )
}, ask = FALSE)
tar_make()
tar_make()
tar_dispatched()
tar_dispatched(starts_with("y_"))  # see also any_of()
})
}
```

---

**tar_edit**  
*Open the target script file for editing.*

Description

Open the target script file for editing. Requires the usethis package.
Usage

tar_edit(script = targets::tar_config_get("script"))

Arguments

script Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

Details

The target script file is an R code file that defines the pipeline. The default path is _targets.R, but the default for the current project can be configured with tar_config_set() 

See Also

Other scripts: tar_github_actions(), tar_helper(), tar_helper_raw(), tar_renv(), tar_script()

tar_engine_knitr  
Target Markdown knitr engine

Description

knitr language engine that runs targets code chunks in Target Markdown.

Usage

tar_engine_knitr(options)

Arguments

options A named list of knitr chunk options.

Value

Character, output generated from knitr::engine_output().

Target Markdown interactive mode

Target Markdown has two modes:

1. Non-interactive mode. This is the default when you run knitr::knit() or rmarkdown::render(). Here, the code in targets code chunks gets written to special script files in order to set up a targets pipeline to run later.

2. Interactive mode: here, no scripts are written to set up a pipeline. Rather, the globals or targets in question are run in the current environment and the values are assigned to that environment.
The mode is interactive if `!isTRUE(getOption("knitr.in.progress"))`, is TRUE. The `knitr.in.progress` option is TRUE when you run `knitr:::knit()` or `rmarkdown:::render()` and NULL if you are running one chunk at a time interactively in an integrated development environment, e.g. the notebook interface in RStudio: https://bookdown.org/yihui/rmarkdown/notebook.html. You can choose the mode with the `tar_interactive` chunk option. (In targets 0.6.0, `tar_interactive` defaults to `interactive()` instead of `!isTRUE(getOption("knitr.in.progress"))`.)

**Target Markdown chunk options**

Target Markdown introduces the following `knitr` code chunk options. Most other standard `knitr` code chunk options should just work in non-interactive mode. In interactive mode, not all

- `tar_globals`: Logical of length 1, whether to define globals or targets. If TRUE, the chunk code defines functions, objects, and options common to all the targets. If FALSE or NULL (default), then the chunk returns formal targets for the pipeline.
- `tar_interactive`: Logical of length 1, whether to run in interactive mode or non-interactive mode. See the "Target Markdown interactive mode" section of this help file for details.
- `tar_name`: name to use for writing helper script files (e.g. `_targets_r/targets/target_script.R`) and specifying target names if the `tar_simple` chunk option is TRUE. All helper scripts and target names must have unique names, so please do not set this option globally with `knitr:::opts_chunk$set()`.
- `tar_script`: Character of length 1, where to write the target script file in non-interactive mode. Most users can skip this option and stick with the default `_targets.R` script path. Helper script files are always written next to the target script in a folder with an "_r" suffix. The `tar_script` path must either be absolute or be relative to the project root (where you call `tar_make()` or similar). If not specified, the target script path defaults to `tar_config_get("script")` (default: `_targets.R`; helpers default: `_targets_r/`). When you run `tar_make()` etc. with a non-default target script, you must select the correct target script file either with the script argument or with `tar_config_set(script = ...)`. The function will `source()` the script file from the current working directory (i.e. with `chdir = FALSE` in `source()`).
- `tar_simple`: Logical of length 1. Set to TRUE to define a single target with a simplified interface. In code chunks with `tar_simple` equal to TRUE, the chunk label (or the `tar_name` chunk option if you set it) becomes the name, and the chunk code becomes the command. In other words, a code chunk with label `targetname` and command `mycommand()` automatically gets converted to `tar_target(name = targetname, command = mycommand())`. All other arguments of `tar_target()` remain at their default values (configurable with `tar_option_set()` in a `tar_globals = TRUE` chunk).

Other Target Markdown: `tar_interactive()`, `tar_noninteractive()`, `tar_toggle()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  # Register the engine.
  if (requireNamespace("knitr", quietly = TRUE)) {
    knitr:::knit_engines$set(targets = targets::tar_engine_knitr)
  }
}
```
For developers only: get the environment of the current target.

**Description**

For developers only: get the environment where a target runs its command. Designed to be called while the target is running. The environment inherits from \texttt{tar\_option\_get("envir")}.

**Usage**

\texttt{tar\_envir(default = parent.frame())}

**Arguments**

- \texttt{default}\hspace{1em}Environment, value to return if \texttt{tar\_envir()} is called on its own outside a \texttt{targets} pipeline. Having a default lets users run things without \texttt{tar\_make()}, which helps peel back layers of code and troubleshoot bugs.

**Details**

Most users should not use \texttt{tar\_envir()} because accidental modifications to \texttt{parent.env(tar\_envir())} could break the pipeline. \texttt{tar\_envir()} only exists in order to support third-party interface packages, and even then the returned environment is not modified.

**Value**

If called from a running target, \texttt{tar\_envir()} returns the environment where the target runs its command. If called outside a pipeline, the return value is whatever the user supplies to \texttt{default} (which defaults to \texttt{parent.frame()}).

**See Also**

Other utilities: \texttt{tar\_active()}, \texttt{tar\_backoff()}, \texttt{tar\_call()}, \texttt{tar\_cancel()}, \texttt{tar\_definition()}, \texttt{tar\_group()}, \texttt{tar\_name()}, \texttt{tar\_path()}, \texttt{tar\_path\_script()}, \texttt{tar\_path\_script\_support()}, \texttt{tar\_path\_store()}, \texttt{tar\_path\_target()}, \texttt{tar\_source()}, \texttt{tar\_store()}

"Then, \texttt{targets}' code chunks in a knitr report will run as described at \texttt{<https://books.ropensci.org/targets/literate-programming.html>}.

For developers only: get the environment of the current target.
**Examples**

```r
tar_envir()

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {
  tar_dir()
  tar_script(tar_target(x, tar_envir(default = parent.frame())))
  tar_make(x)
  tar_read(x)
}
```

---

**Description**

Show all the special environment variables available for customizing targets.

**Usage**

```r
tar_envvars(unset = "")
```

**Arguments**

- **unset**: Character of length 1, value to return for any environment variable that is not set.

**Details**

You can customize the behavior of targets with special environment variables. The sections in this help file describe each environment variable, and the `tar_envvars()` function lists their current values.

If you modify environment variables, please set them in project-level `.Renviron` file so you do not lose your configuration when you restart your R session. Modify the project-level `.Renviron` file with `usethis::edit_r_environ(scope = "project")`. Restart your R session after you are done editing.

For targets that run on parallel workers created by `tar_make_clustermq()` or `tar_make_future()`, only the environment variables listed by `tar_envvars()` are specifically exported to the targets. For all other environment variables, you will have to set the values manually, e.g. a project-level `.Renviron` file (for workers that have access to the local file system).

**Value**

A data frame with one row per environment variable and columns with the name and current value of each. An unset environment variable will have a value of "" by default. (Customize with the unset argument).
TAR_ASK

The TAR_ASK environment variable accepts values "true" and "false". If TAR_ASK is not set, or if it is set to "true", then targets asks permission in a menu before overwriting certain files, such as the target script file (default: _targets.R) in `tar_script()`. If TAR_ASK is "false", then targets overwrites the old files with the new ones without asking. Once you are comfortable with `tar_script()`, `tar_github_actions()`, and similar functions, you can safely set TAR_ASK to "false" in either a project-level or user-level .Renviron file.

TAR_CONFIG

The TAR_CONFIG environment variable controls the file path to the optional YAML configuration file with project settings. See the help file of `tar_config_set()` for details.

TAR_PROJECT

The TAR_PROJECT environment variable sets the name of project to set and get settings when working with the YAML configuration file. See the help file of `tar_config_set()` for details.

TAR_WARN

The TAR_WARN environment variable accepts values "true" and "false". If TAR_WARN is not set, or if it is set to "true", then targets throws warnings in certain edge cases, such as target/global name conflicts and dangerous use of `devtools::load_all()`. If TAR_WARN is "false", then targets does not throw warnings in these cases. These warnings can detect potentially serious issues with your pipeline, so please do not set TAR_WARN unless your use case absolutely requires it.

Examples

tar_envvars()

```
tar_errored

List errored targets.
```

Description

List targets whose progress is "errored".

Usage

tar_errored(names = NULL, store = targets::tar_config("store"))
Arguments

names     Optional, names of the targets. If supplied, the function restricts its output to these targets. You can supply symbols or tidyselect helpers like \texttt{any\_of()} and \texttt{starts\_with()}.

store     Character of length 1, path to the targets data store. Defaults to \texttt{tar\_config\_get("store")}, which in turn defaults to \_targets/\. When you set this argument, the value of \texttt{tar\_config\_get("store")} is temporarily changed for the current function call. See \texttt{tar\_config\_get()} and \texttt{tar\_config\_set()} for details about how to set the data store path persistently for a project.

Value

A character vector of errored targets.

Storage access

Several functions like \texttt{tar\_make()}, \texttt{tar\_read()}, \texttt{tar\_load()}, \texttt{tar\_meta()}, and \texttt{tar\_progress()} read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as \texttt{tar\_render()} and \texttt{tar\_quarto()}.

Several functions like \texttt{tar\_make()}, \texttt{tar\_read()}, \texttt{tar\_load()}, \texttt{tar\_meta()}, and \texttt{tar\_progress()} read or modify the local data store of the pipeline. Examples

```r
if (identical(Sys.getenv("TAR\_EXAMPLES"), "true")) { # for CRAN
tar\_dir({ # tar\_dir() runs code from a temp dir for CRAN.
tar\_script({
    list(
        tar\_target(x, seq\_len(2)),
        tar\_target(y, 2 * x, pattern = map(x))
    )
}, ask = FALSE)
tar\_make()
tar\_errored()
tar\_errored\_starts\_with("y_") # see also any\_of()
})
```
**tar_exist_meta**

Check if target metadata exists.

**Description**

Check if the target metadata file `_targets/meta/meta` exists for the current project.

**Usage**

```r
.tar_exist_meta(store = targets::tar_config_get("store"))
```

**Arguments**

- `store`: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Details**

To learn more about data storage in targets, visit [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html).

**Value**

Logical of length 1, whether the current project’s metadata exists.

**See Also**

Other existence: `tar_exist_objects()`, `tar_exist_process()`, `tar_exist_progress()`, `tar_exist_script()`

**Examples**

```r
tar_exist_meta()
```

---

**tar_exist_objects**

Check if local output data exists for one or more targets.

**Description**

Check if output target data exists in either `_targets/objects/` or the cloud for one or more targets.
Usage

tar_exist_objects(
  names,
  cloud = TRUE,
  store = targets::tar_config_get("store")
)

Arguments

names Character vector of target names.
cloud Logical of length 1, whether to include cloud targets in the output (e.g. tar_target(...,
  repository = "aws").
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"),
  which in turn defaults to _targets/_. When you set this argument, the value
  of tar_config_get("store") is temporarily changed for the current function
  call. See tar_config_get() and tar_config_set() for details about how to
  set the data store path persistently for a project.

Details

If a target has no metadata or if the repository argument of tar_target() was set to "local",
then the _targets/objects/ folder is checked. Otherwise, if there is metadata and repository is
not "local", then tar_exist_objects() checks the cloud repository selected.

Value

Logical of length length(names), whether each given target has an existing file in either _targets/objects/
or the cloud.

See Also

Other existence: tar_exist_meta(), tar_exist_process(), tar_exist_progress(), tar_exist_script()

Examples

tar_exist_objects(c("target1", "target2"))

tar_exist_process Check if process metadata exists.

Description

Check if the process metadata file _targets/meta/process exists for the current project.

Usage

tar_exist_process(store = targets::tar_config_get("store"))
Arguments

store
Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

To learn more about data storage in targets, visit https://books.ropensci.org/targets/data.html.

Value

Logical of length 1, whether the current project’s metadata exists.

See Also

Other existence: `tar_exist_meta()`, `tar_exist_objects()`, `tar_exist_progress()`, `tar_exist_script()`

Examples

tar_exist_process()

---

tar_exist_progress  

**Check if progress metadata exists.**

Description

Check if the progress metadata file `_targets/meta/progress` exists for the current project.

Usage

tar_exist_progress(store = targets::tar_config_get("store"))

Arguments

store
Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

To learn more about data storage in targets, visit https://books.ropensci.org/targets/data.html.
Value

Logical of length 1, whether the current project’s metadata exists.

See Also

Other existence: `tar_exist_meta()`, `tar_exist_objects()`, `tar_exist_process()`, `tar_exist_script()`

Examples

`tar_exist_progress()`

tar_exist_script

Check if the target script file exists.

Description

Check if the target script file exists for the current project. The target script is `_targets.R` by default, but the path can be configured for the current project using `tar_config_set()`.

Usage

`tar_exist_script(script = targets::tar_config_get("script"))`

Arguments

script Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

Value

Logical of length 1, whether the current project’s metadata exists.

See Also

Other existence: `tar_exist_meta()`, `tar_exist_objects()`, `tar_exist_process()`, `tar_exist_progress()`

Examples

`tar_exist_script()`
**tar_format**  

Define a custom target storage format.

**Description**

Define a custom target storage format for the `format` argument of `tar_target()` or `tar_option_set()`.

**Usage**

```r
r
 tar_format(
   read = NULL,
   write = NULL,
   marshal = NULL,
   unmarshal = NULL,
   convert = NULL,
   copy = NULL,
   repository = NULL
)
```

**Arguments**

- **read** A function with a single argument named `path`. This function should read and return the target stored at the file in the argument. It should have no side effects. See the “Format functions” section for specific requirements. If NULL, the read argument defaults to `readRDS()`.

- **write** A function with two arguments: `object` and `path`, in that order. This function should save the R object `object` to the file path at `path` and have no other side effects. The function need not return a value, but the file written to `path` must be a single file, and it cannot be a directory. See the “Format functions” section for specific requirements. If NULL, the write argument defaults to `saveRDS()` with `version = 3`.

- **marshal** A function with a single argument named `object`. This function should marshal the R object and return an in-memory object that can be exported to remote parallel workers. It should not read or write any persistent files. See the Marshalling section for details. See the “Format functions” section for specific requirements. If NULL, the marshal argument defaults to just returning the original object without any modifications.

- **unmarshal** A function with a single argument named `object`. This function should unmarshal the (marshalled) R object and return an in-memory object that is appropriate and valid for use on a parallel worker. It should not read or write any persistent files. See the Marshalling section for details. See the "Format functions" section for specific requirements. If NULL, the unmarshal argument defaults to just returning the original object without any modifications.

- **convert** The `convert` argument is a function that accepts the object returned by the command of the target and changes it into an acceptable format (e.g. can be saved
with the read function). The convert ensures the in-memory copy of an object during the running pipeline session is the same as the copy of the object that is saved to disk. The function should be idempotent, and it should handle edge cases like NULL values (especially for error = "null" in `tar_target()` or `tar_option_set()`). If NULL, the convert argument defaults to just returning the original object without any modifications.

**copy**

The copy argument is a function that accepts the object returned by the command of the target and makes a deep copy in memory. This method does is relevant to objects like `data.table` objects that support in-place modification which could cause unpredictable side effects from target to target. In cases like these, the target should be deep-copied before a downstream target attempts to use it (in the case of `data.table` objects, using `data.table::copy()`). If NULL, the copy argument defaults to just returning the original object without any modifications.

**repository**

Deprecated. Use the repository argument of `tar_target()` or `tar_option_set()` instead.

### Details

It is good practice to write formats that correctly handle NULL objects if you are planning to set error = "null" in `tar_option_set()`.

### Value

A character string of length 1 encoding the custom format. You can supply this string directly to the format argument of `tar_target()` or `tar_option_set()`.

### Marshalling

If an object can only be used in the R session where it was created, it is called "non-exportable". Examples of non-exportable R objects are Keras models, Torch objects, xgboost matrices, `xml2` documents, `rstan` model objects, `sparklyr` data objects, and database connection objects. These objects cannot be exported to parallel workers (e.g. for `tar_make_future()`) without special treatment. To send an non-exportable object to a parallel worker, the object must be marshalled: converted into a form that can be exported safely (similar to serialization but not always the same). Then, the worker must unmarshal the object: convert it into a form that is usable and valid in the current R session. Arguments `marshal` and `unmarshal` of `tar_format()` let you control how marshalling and unmarshalling happens.

### Format functions

In `tar_format()`, functions like read, write, marshal, and unmarshal must be perfectly pure and perfectly self-sufficient. They must load or namespace all their own packages, and they must not depend on any custom user-defined functions or objects in the global environment of your pipeline. targets converts each function to and from text, so it must not rely on any data in the closure. This disqualifies functions produced by `Vectorize()`, for example.

The write function must write only a single file, and the file it writes must not be a directory.
The functions to read and write the object should not do any conversions on the object. That is the job of the convert argument. The convert argument is a function that accepts the object returned by the command of the target and changes it into an acceptable format (e.g. can be saved with the read function). Working with the convert function is best because it ensures the in-memory copy of an object during the running pipeline session is the same as the copy of the object that is saved to disk.

See Also

Other targets: `tar_cue()`, `tar_target()`, `tar_target_raw()`

Examples

```r
# The following target is equivalent to the current superseded
tar_target(name, command(), format = "keras").
# An improved version of this would supply a `convert` argument
# to handle NULL objects, which are returned by the target if it
# errors and the error argument of tar_target() is "null".
tar_target(
  name = keras_target,
  command = your_function(),
  format = tar_format(
    read = function(path) {
      keras::load_model_hdf5(path)
    },
    write = function(object, path) {
      keras::save_model_hdf5(object = object, filepath = path)
    },
    marshal = function(object) {
      keras::serialize_model(object)
    },
    unmarshal = function(object) {
      keras::unserialize_model(object)
    }
  )
)

# And the following is equivalent to the current superseded
tar_target(name, torch::torch_tensor(seq_len(4)), format = "torch"),
# except this version has a `convert` argument to handle
# cases when `NULL` is returned (e.g. if the target errors out
# and the `error` argument is "null" in tar_target()
# or tar_option_set())
tar_target(
  name = torch_target,
  command = torch::torch_tensor(),
  format = tar_format(
    read = function(path) {
      torch::torch_load(path)
    },
    write = function(object, path) {
      torch::torch_save(obj = object, path = path)
    },
  )
)
marshal = function(object) {
  con <- rawConnection(raw(), open = "wr")
  on.exit(close(con))
  torch::torch_save(object, con)
  rawConnectionValue(con)
},
unmarshal = function(object) {
  con <- rawConnection(object, open = "r")
  on.exit(close(con))
  torch::torch_load(con)
}

---

tar_github_actions

Set up GitHub Actions to run a targets pipeline

Description

Writes a GitHub Actions workflow file so the pipeline runs on every push to GitHub. Historical runs accumulate in the targets-runs branch, and the latest output is restored before `tar_make()` so up-to-date targets do not rerun.

Usage

```r
tar_github_actions(
  path = file.path(".github", "workflows", "targets.yaml"),
  ask = NULL
)
```

Arguments

- **path** Character of length 1, file path to write the GitHub Actions workflow file.
- **ask** Logical, whether to ask before writing if the workflow file already exists. If NULL, defaults to `Sys.getenv("TAR_ASK")`. (Set to "true" or "false" with `Sys.setenv()`). If `ask` and the `TAR_ASK` environment variable are both indeterminate, defaults to `interactive()`.

Details

Steps to set up continuous deployment:

1. Ensure your pipeline stays within the resource limitations of GitHub Actions and repositories, both for storage and compute. For storage, you may wish to reduce the burden with an alternative repository (e.g. `tar_target(..., repository = "aws")`).
2. Ensure Actions are enabled in your GitHub repository. You may have to visit the Settings tab.
3. Call `targets::tar_renv(extras = character(0))` to expose hidden package dependencies.
4. Set up renv for your project (with renv::init() or renv::snapshot()). Details at [https://rstudio.github.io/renv/articles/ci.html](https://rstudio.github.io/renv/articles/ci.html).

5. Commit the renv.lock file to the main (recommended) or master Git branch.

6. Run `tar_github_actions()` to create the workflow file. Commit this file to main (recommended) or master in Git.

7. Push your project to GitHub. Verify that a GitHub Actions workflow runs and pushes results to targets-runs. Subsequent runs will only recompute the outdated targets.

**Value**

Nothing (invisibly). This function writes a GitHub Actions workflow file as a side effect.

**See Also**

Other scripts: `tar_edit()`, `tar_helper()`, `tar_helper_raw()`, `tar_renv()`, `tar_script()`

**Examples**

```r
tar_github_actions(tempfile())
```

---

**Description**

Analyze the pipeline defined in the target script file (default: `_targets.R`) and visualize the directed acyclic graph of targets. Unlike `tar_visnetwork()`, `tar_glimpse()` does not account for metadata or progress information, which means the graph renders faster. Also, `tar_glimpse()` omits functions and other global objects by default (but you can include them with `targets_only = FALSE`).

**Usage**

```r
tar_glimpse(
  targets_only = TRUE,
  names = NULL,
  shortcut = FALSE,
  allow = NULL,
  exclude = ".Random.seed",
  level_separation = targets::tar_config_get("level_separation"),
  degree_from = 1L,
  degree_to = 1L,
  zoom_speed = 1,
  physics = FALSE,
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function),
  envir = parent.frame(),
)```
script = targets::tar_config_get("script"),
store = targets::tar_config_get("store")
)

Arguments

**targets_only** Logical, whether to restrict the output to just targets (FALSE) or to also include global functions and objects.

**names** Names of targets. The graph visualization will operate only on these targets (and unless shortcut is TRUE, all the targets upstream as well). Selecting a small subgraph using names could speed up the load time of the visualization. Unlike allow, names is invoked before the graph is generated. Set to NULL to check/run all the targets (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with(). Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not individual dynamic branches.

**shortcut** Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Also, shortcut = TRUE only works if you set names.

**allow** Optional, define the set of allowable vertices in the graph. Unlike names, allow is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to allow all vertices in the pipeline and environment (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with().

**exclude** Optional, define the set of exclude vertices from the graph. Unlike names, exclude is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to exclude no vertices. Otherwise, you can supply symbols or tidyselect helpers like any_of() and starts_with().

**level_separation** Numeric of length 1, levelSeparation argument of visNetwork::visHierarchicalLayout(). Controls the distance between hierarchical levels. Consider changing the value if the aspect ratio of the graph is far from 1. If level_separation is NULL, the levelSeparation argument of visHierarchicalLayout() defaults to 150.

**degree_from** Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_from controls the number of edges the neighborhood extends upstream.

**degree_to** Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_to controls the number of edges the neighborhood extends downstream.

**zoom_speed** Positive numeric of length 1, scaling factor on the zoom speed. Above 1 zooms faster than default, below 1 zooms lower than default.

**physics** Logical of length 1, whether to implement interactive physics in the graph, e.g. edge elasticity.
callr_function: A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, callr_function should not be NULL for serious reproducible work.

callr_arguments: A list of arguments to callr_function.

envir: An environment, where to run the target R script (default: `_targets.R`) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then envir2 will be used.

script: Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

store: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

A visNetwork HTML widget object.

Dependency graph

The dependency graph of a pipeline is a directed acyclic graph (DAG) where each node indicates a target or global object and each directed edge indicates where a downstream node depends on an upstream node. The DAG is not always a tree, but it never contains a cycle because no target is allowed to directly or indirectly depend on itself. The dependency graph should show a natural progression of work from left to right. targets uses static code analysis to create the graph, so the order of `tar_target()` calls in the `_targets.R` file does not matter. However, targets does not support self-referential loops or other cycles. For more information on the dependency graph, please read https://books.ropensci.org/targets/targets.html#dependencies.

Storage access

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is
tar_group

Group a data frame to iterate over subsets of rows.

Description

Like dplyr::group_by(), but for patterns. tar_group() allows you to map or cross over subsets of data frames. Requires iteration = "group" on the target. See the example.

Usage

```
tar_group(x)
```

Arguments

x Grouped data frame from dplyr::group_by()
Details

The goal of `tar_group()` is to post-process the return value of a data frame target to allow downstream targets to branch over subsets of rows. It takes the groups defined by `dplyr::group_by()` and translates that information into a special `tar_group` column. `tar_group` is a vector of positive integers from 1 to the number of groups. Rows with the same integer in `tar_group` belong to the same group, and branches are arranged in increasing order with respect to the integers in `tar_group`. The assignment of `tar_group` integers to group levels depends on the orderings inside the grouping variables and not the order of rows in the dataset. `dplyr::group_keys()` on the grouped data frame shows how the grouping variables correspond to the integers in the `tar_group` column.

Value

A data frame with a special `tar_group` column that targets will use to find subsets of your data frame.

See Also

Other utilities: `tar_active()`, `tar_backoff()`, `tar_call()`, `tar_cancel()`, `tar_definition()`, `tar_envir()`, `tar_name()`, `tar_path()`, `tar_path_script()`, `tar_path_script_support()`, `tar_path_store()`, `tar_path_target()`, `tar_source()`, `tar_store()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  # The `tar_group()` function simply creates
  # a `tar_group` column to partition the rows
  # of a data frame.
  data.frame(
    x = seq_len(6),
    id = rep(letters[seq_len(3)], each = 2)
  ) %>%
  dplyr::group_by(id) %>%
  tar_group()
  # We use `tar_group()` below to branch over
  # subsets of a data frame defined with `dplyr::group_by()`.
  tar_dir({ # `tar_dir()` runs code from a temp dir for CRAN.
    library(dplyr)
    list(
      tar_target(
        data,
        data.frame(
          x = seq_len(6),
          id = rep(letters[seq_len(3)], each = 2)
        ) %>%
        group_by(id) %>%
        tar_group(),
        iteration = "group"
      ),
      tar_target(
    )
  })
```
```
sums,
  sum(data$x),
  pattern = map(data),
  iteration = "vector"
)
}
tar_make()
tar_read(sums) # Should be c(3, 7, 11).
}
```

---

**tar_helper**

Write a helper R script.

### Description

Write a helper R script for a targets pipeline. Could be supporting functions or the target script file (default: _targets.R) itself.

### Usage

```
tar_helper(path = NULL, code = NULL, tidy_eval = TRUE, envir = parent.frame())
```

### Arguments

- **path**: Character of length 1, path to write (or overwrite) code. If the parent directory does not exist, `tar_helper_raw()` creates it.
- **code**: Quoted code to write to path. `tar_helper()` overwrites the file if it already exists.
- **tidy_eval**: Logical, whether to use tidy evaluation on code. If turned on, you can substitute expressions and symbols using `!!` and `!!!`. See examples below.
- **envir**: Environment for tidy evaluation.

### Details

`tar_helper()` is a specialized version of `tar_script()` with flexible paths and tidy evaluation.

### Value

`NULL` (invisibly)

### See Also

Other scripts: `tar_edit()`, `tar_github_actions()`, `tar_helper_raw()`, `tar_renv()`, `tar_script()`
Examples

# Without tidy evaluation:
path <- tempfile()
tar_helper(path, x <- 1)
writelines(readlines(path))

# With tidy evaluation:
y <- 123
tar_helper(path, x <- !!y)
writelines(readlines(path))

---

tar_helper_raw  Write a helper R script (raw version).

Description

Write a helper R script for a targets pipeline. Could be supporting functions or the target script file (default: _targets.R) itself.

Usage

tar_helper_raw(path = NULL, code = NULL)

Arguments

path
  Character of length 1, path to write (or overwrite) code. If the parent directory does not exist, tar_helper_raw() creates it.

code
  Expression object. tar_helper_raw() deparses and writes this code to a file at path, overwriting it if the file already exists.

Details

tar_helper_raw() is a specialized version of tar_script() with flexible paths and tidy evaluation. It is like tar_helper() except that code is an "evaluated" argument rather than a quoted one.

Value

NULL (invisibly)

See Also

Other scripts: tar_edit(), tar_github_actions(), tar_helper(), tar_renv(), tar_script()

Examples

path <- tempfile()
tar_helper_raw(path, quote(x <- 1))
writelines(readlines(path))
**tar_interactive**

Run if Target Markdown interactive mode is on.

**Description**

In Target Markdown, run the enclosed code only if interactive mode is activated. Otherwise, do not run the code.

**Usage**

```r
tar_interactive(code)
```

**Arguments**

- `code` R code to run if Target Markdown interactive mode is turned on.

**Details**

Visit [books.ropensci.org/targets/literate-programming.html](http://books.ropensci.org/targets/literate-programming.html) to learn about Target Markdown and interactive mode.

**Value**

If Target Markdown interactive mode is turned on, the function returns the result of running the code. Otherwise, the function invisibly returns `NULL`.

**See Also**

Other Target Markdown: `tar_engine_knitr()`, `tar_noninteractive()`, `tar_toggle()`

**Examples**

```r
tar_interactive(message("In interactive mode."))
```

---

**tar_invalidate**

Delete one or more metadata records (e.g. to rerun a target).

**Description**

Delete the metadata of records in `_targets/meta/meta` but keep the return values of targets in `_targets/objects/`.

**Usage**

```r
tar_invalidate(names, store = targets::tar_config_get("store"))
```
**tar_invalidate**

Arguments

- **names**: Names of the targets to remove from the metadata list. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

This function forces one or more targets to rerun on the next `tar_make()`, regardless of the cues and regardless of how those targets are stored. After `tar_invalidate()`, you will still be able to locate the data files with `tar_path_target()` and manually salvage them in an emergency. However, `tar_load()` and `tar_read()` will not be able to read the data into R, and subsequent calls to `tar_make()` will attempt to rerun those targets. For patterns recorded in the metadata, all the branches will be invalidated. For patterns no longer in the metadata, branches are left alone.

Value

`NULL` (invisibly).

Storage access

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

See Also

Other clean: `tar_delete()`, `tar_destroy()`, `tar_prune()`, `tar_prune_list()`, `tar_unversion()`

Examples

```r
if(identical(Sys.getenv("TAR_EXAMPLES"), "true")){ # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(y1, 1 + 1),
    tar_target(y2, 1 + 1),
  )
})
}
```

These functions help with metaprogramming in packages built on top of targets.

**Usage**

- `tar_deparse_language(expr)`
- `tar_deparse_safe(expr, collapse = "\n", backtick = TRUE)`
- `tar_tidy_eval(expr, envir, tidy_eval)`
- `tar_tidyselect_eval(names_quosure, choices)`

**Arguments**

- **expr** A language object to modify or deparse.
- **collapse** Character of length 1, delimiter in deparsing.
- **backtick** logical indicating whether symbolic names should be enclosed in backticks if they do not follow the standard syntax.
- **envir** An environment to find objects for tidy evaluation.
- **tidy_eval** Logical of length 1, whether to apply tidy evaluation.
- **names_quosure** An `rlang` quosure with `tidyselect` expressions.
- **choices** A character vector of choices for character elements returned by tidy evaluation.

**Details**

- `tar_deparse_language()` is a wrapper around `tar_deparse_safe()` which leaves character vectors and NULL objects alone, which helps with subsequent user input validation.
- `tar_deparse_safe()` is a wrapper around `base::deparse()` with a custom set of fast default settings and guardrails to ensure the output always has length 1.
- `tar_tidy_eval()` applies tidy evaluation to a language object and returns another language object.
- `tar_tidyselect_eval()` applies tidyselect selection with some special guardrails around NULL inputs.
See Also

Other utilities to extend targets: `tar_assert`, `tar_condition`, `tar_test()`

Examples

```r
tar_deparse_language(quote(run_model()))
```

**Description**

Load the return values of targets into the current environment (or the environment of your choosing). For a typical target, the return value lives in a file in `_targets/objects/`. For dynamic files (i.e. `format = "file"`) the paths loaded in place of the values. `tar_load_everything()` is shorthand for `tar_load(everything())` to load all targets.

**Usage**

```r
tar_load(
  names, 
  branches = NULL, 
  meta = tar_meta(targets_only = TRUE, store = store), 
  strict = TRUE, 
  silent = FALSE, 
  envir = parent.frame(), 
  store = targets::tar_config_get("store")
)
```

**Arguments**

- `names` Names of the targets to load. You may supply tidyselect helpers like `any_of()` and `starts_with()`. Names are selected from the metadata in `_targets/meta`, which may include errored targets.
- `branches` Integer of indices of the branches to load for any targets that are patterns.
- `meta` Data frame of metadata from `tar_meta()`. `tar_read()` with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call `tar_meta()` beforehand and supply it to the `meta` argument, then successive calls to `tar_read()` may run much faster.
- `strict` Logical of length 1, whether to error out if one of the selected targets is in the metadata but cannot be loaded. Set to `FALSE` to just load the targets in the metadata that can be loaded and skip the others.
- `silent` Logical of length 1. Only relevant when `strict` is `FALSE`. If `silent` is `FALSE` and `strict` is `FALSE`, then a message will be printed if a target is in the metadata but cannot be loaded. However, load failures will not stop other targets from being loaded.
Environment to put the loaded targets.

store
Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to _targets_. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value
Nothing.

Storage access
Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as `tar_render()` and `tar_quarto()`.

So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as `tar_render()` and `tar_quarto()`.

Cloud target data versioning
Some buckets in Amazon S3 or Google Cloud Storage are “versioned”, which means they track historical versions of each data object. If you use targets with cloud storage (https://books.ropensci.org/targets/cloud-storage.html) and versioning is turned on, then targets will record each version of each target in its metadata.

Functions like `tar_read()` and `tar_load()` load the version recorded in the local metadata, which may not be the same as the “current” version of the object in the bucket. Likewise, functions `tar_delete()` and `tar_destroy()` only remove the version ID of each target as recorded in the local metadata.

If you want to interact with the latest version of an object instead of the version ID recorded in the local metadata, then you will need to delete the object from the metadata.

1. Make sure your local copy of the metadata is current and up to date. You may need to run `tar_meta_download()` or `tar_meta_sync()` first.
2. Run `tar_unversion()` to remove the recorded version IDs of your targets in the local metadata.
3. With the version IDs gone from the local metadata, functions like `tar_read()` and `tar_destroy()` will use the latest version of each target data object.
4. Optional: to back up the local metadata file with the version IDs deleted, use `tar_meta_upload()`.
**See Also**

Other data: `tar_crew()`, `tar_load_everything()`, `tar_load_raw()`, `tar_objects()`, `tar_pid()`, `tar_process()`, `tar_read()`, `tar_read_raw()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
    list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
    ), ask = FALSE)
tar_make()
ls() # Does not have "y1", "y2", or "z".
tar_load(starts_with("y"))
ls() # Has "y1" and "y2" but not "z".
tar_load(any_of("z"))
ls() # Has "y1", "y2", and "z".
})}
```

---

**tar_load_everything**  
Load the values of all available targets.

**Description**

Shorthand for `tar_load(everything())` to load all targets with entries in the metadata.

**Usage**

```r
tar_load_everything(
    branches = NULL,
    meta = tar_meta(targets_only = TRUE, store = store),
    strict = TRUE,
    silent = FALSE,
    envir = parent.frame(),
    store = targets::tar_config_get("store")
)
```

**Arguments**

- `branches`  
  Integer of indices of the branches to load for any targets that are patterns.

- `meta`  
  Data frame of metadata from `tar_meta()`. `tar_read()` with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call `tar_meta()` beforehand and supply it to the `meta` argument, then successive calls to `tar_read()` may run much faster.
Load globals for debugging, testing, and prototyping

Load user-defined packages, functions, global objects, and settings defined in the target script file (default: _targets.R). This function is for debugging, testing, and prototyping only. It is not recommended for use inside a serious pipeline or to report the results of a serious pipeline.
Usage

tar_load_globals(
  envir = parent.frame(),
  script = targets::tar_config_get("script")
)

Arguments

envir Environment to source the target script (default: _targets.R). Defaults to the calling environment.

script Character of length 1, path to the target script file that defines the pipeline (_targets.R by default). This path should be either an absolute path or a path relative to the project root where you will call tar_make() and other functions. When tar_make() and friends run the script from the current working directory. If the argument NULL, the setting is not modified. Use tar_config_unset() to delete a setting.

Details

This function first sources the target script file (default: _targets.R) to loads all user-defined functions, global objects, and settings into the current R process. Then, it loads all the packages defined in tar_option_get("packages") (default: packages()) using library() with lib.loc defined in tar_option_get("library") (default: NULL).

Value

NULL (invisibly).

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

See Also

Other debug: tar_traceback(), tar_workspace(), tar_workspaces()
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {  # for CRAN
  tar_dir({  # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      tar_option_set(packages = "callr")
      analyze_data <- function(data) {
        summary(data)
      }
      list(
        tar_target(x, 1 + 1),
        tar_target(y, 1 + 1)
      )
    }, ask = FALSE)
    tar_loadGlobals()
    print(analyze_data)
    print("callr" %in% (.packages()))
  })
}
```

**Description**

Load the values of targets (raw version).

**Usage**

```r
tar_load_raw(
  names,
  branches = NULL,
  meta = tar_meta(store = store),
  strict = TRUE,
  silent = FALSE,
  envir = parent.frame(),
  store = targets::tar_config_get("store")
)
```

**Arguments**

- **names**
  - Character vector, names of the targets to load. Names are expected to appear in the metadata in \_targets/meta. Any target names not in the metadata are ignored.

- **branches**
  - Integer of indices of the branches to load for any targets that are patterns.
**meta**

Data frame of metadata from `tar_meta()`. `tar_read()` with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call `tar_meta()` beforehand and supply it to the `meta` argument, then successive calls to `tar_read()` may run much faster.

**strict**

Logical of length 1, whether to error out if one of the selected targets is in the metadata but cannot be loaded. Set to `FALSE` to just load the targets in the metadata that can be loaded and skip the others.

**silent**

Logical of length 1. Only relevant when `strict` is `FALSE`. If `silent` is `FALSE` and `strict` is `FALSE`, then a message will be printed if a target is in the metadata but cannot be loaded. However, load failures will not stop other targets from being loaded.

**envir**

Environment to put the loaded targets.

**store**

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

Nothing.

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(y1, 1 + 1),
    tar_target(y2, 1 + 1),
    tar_target(z, y1 + y2)
  )
}, ask = FALSE)
tar_make()
tar_load_raw(any_of(c("y1", "y2")))
y1
y2
})
}
```

---

**tar_make**  
Run a pipeline of targets.

**Description**

Run the pipeline you defined in the targets script file (default: `_targets.R`). `tar_make()` runs the correct targets in the correct order and stores the return values in `_targets/objects/`. Use `tar_read()` to read a target back into R, and see [https://docs.ropensci.org/targets/reference/index.html#clean](https://docs.ropensci.org/targets/reference/index.html#clean) to manage output files.
Usage

```r
tar_make(
  names = NULL,
  shortcut = targets::tar_config_get("shortcut"),
  reporter = targets::tar_config_get("reporter_make"),
  seconds_meta_append = targets::tar_config_get("seconds_meta_append"),
  seconds_meta_upload = targets::tar_config_get("seconds_meta_upload"),
  seconds_reporter = targets::tar_config_get("seconds_reporter"),
  seconds_interval = targets::tar_config_get("seconds_interval"),
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function, reporter),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store"),
  garbage_collection = targets::tar_config_get("garbage_collection"),
  use_crew = targets::tar_config_get("use_crew"),
  terminate_controller = TRUE,
  as_job = targets::tar_config_get("as_job"))
```

Arguments

**names**
Names of the targets to run or check. Set to NULL to check/run all the targets (default). Otherwise, you can supply tidyselect helpers like `any_of()` and `starts_with()`. Because `tar_make()` and friends run the pipeline in a new R session, if you pass a character vector to a tidyselect helper, you will need to evaluate that character vector early with `!!`, e.g. `tar_make(names = any_of(!!your_vector))`. Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not to individual dynamic branches.

**shortcut**
Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. It relies on stored metadata for information about upstream dependencies. shortcut = TRUE only works if you set names.

**reporter**
Character of length 1, name of the reporter to user. Controls how messages are printed as targets run in the pipeline. Defaults to `tar_config_get("reporter_make")`. Choices:
- "silent": print nothing.
- "summary": print a running total of the number of each targets in each status category (queued, dispatched, skipped, completed, canceled, or errored). Also show a timestamp ("%H:%M %OS2" strftime() format) of the last time the progress changed and printed to the screen.
- "timestamp": same as the "verbose" reporter except that each .message begins with a time stamp.
- "timestamp_positives": same as the "timestamp" reporter except without messages for skipped targets.
- "verbose": print messages for individual targets as they start, finish, or are skipped. Each individual target-specific time (e.g. "3.487 seconds") is strictly the elapsed runtime of the target and does not include steps like data retrieval and output storage.

- "verbose_positives": same as the "verbose" reporter except without messages for skipped targets.

seconds_meta_append
Positive numeric of length 1 with the minimum number of seconds between saves to the local metadata and progress files in the data store. Higher values generally make the pipeline run faster, but unsaved work (in the event of a crash) is not up to date. When the pipeline ends, all the metadata and progress data is saved immediately, regardless of seconds_meta_append.

seconds_meta_upload
Positive numeric of length 1 with the minimum number of seconds between uploads of the metadata and progress data to the cloud (see https://books.ropensci.org/targets/cloud-storage.html). Higher values generally make the pipeline run faster, but unsaved work (in the event of a crash) may not be backed up to the cloud. When the pipeline ends, all the metadata and progress data is uploaded immediately, regardless of seconds_meta_upload.

seconds_reporter
Positive numeric of length 1 with the minimum number of seconds between times when the reporter prints progress messages to the R console.

seconds_interval
Deprecated on 2023-08-24 (version 1.2.2.9001). Use seconds_meta_append, seconds_meta_upload, and seconds_reporter instead.

callr_function
A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments
A list of arguments to callr_function.

envir
An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script
Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of
tar_make

tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

store
Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

garbage_collection
Logical of length 1. For a crew-integrated pipeline, whether to run garbage collection on the main process before sending a target to a worker. Ignored if tar_option_get("controller") is NULL. Independent from the garbage_collection argument of tar_target(), which controls garbage collection on the worker.

use_crew
Logical of length 1, whether to use crew if the controller option is set in tar_option_set() in the target script (_targets.R). See https://books.ropensci.org/targets/crew.html for details.

terminate_controller
Logical of length 1. For a crew-integrated pipeline, whether to terminate the controller after stopping or finishing the pipeline. This should almost always be set to TRUE, but FALSE combined with callr_function = NULL will allow you to get the running controller using tar_option_get("controller") for debugging purposes. For example, tar_option_get("controller")$summary() produces a worker-by-worker summary of the work assigned and completed, tar_option_get("controller")$queue is the list of unresolved tasks, and tar_option_get("controller")$results is the list of tasks that completed but were not collected with pop(). You can manually terminate the controller with tar_option_get("controller")$summary() to close down the dispatcher and worker processes.

as_job
TRUE to run as an RStudio IDE / Posit Workbench job, FALSE to run as a callr process in the main R session (depending on the callr_function argument). If as_job is TRUE, then the rstudioapi package must be installed.

Value
NULL except if callr_function = callr::r_bg(), in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

Storage access
Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(y1, 1 + 1),
    tar_target(y2, 1 + 1),
    tar_target(z, y1 + y2)
  ), ask = FALSE)
) # Only processes y1 and y2.
# Distributed computing with crew:
if (requireNamespace("crew", quietly = TRUE)) {
tar_script({
  tar_option_set(controller = crew::controller_local())
  list(
    tar_target(y1, 1 + 1),
    tar_target(y2, 1 + 1),
    tar_target(z, y1 + y2)
  ), ask = FALSE)
) # Only processes y1 and y2.
tar_make()
} })
}
```

---

tar_make_clustermq  Superseded. Run a pipeline with persistent clustermq workers.

Description

Usage

```r
tar_make_clustermq(
  names = NULL,
  shortcut = targets::tar_config_get("shortcut"),
  reporter = targets::tar_config_get("reporter_make"),
)```

seconds_meta_append = targets::tar_config_get("seconds_meta_append"),
seconds_meta_upload = targets::tar_config_get("seconds_meta_upload"),
seconds_reporter = targets::tar_config_get("seconds_reporter"),
seconds_interval = targets::tar_config_get("seconds_interval"),
workers = targets::tar_config_get("workers"),
log_worker = FALSE,
callr_function = callr::r,
callr_arguments = targets::tar_callr_args_default(callr_function, reporter),
envir = parent.frame(),
script = targets::tar_config_get("script"),
store = targets::tar_config_get("store"),
garbage_collection = targets::tar_config_get("garbage_collection")
)

Arguments

names Names of the targets to run or check. Set to NULL to check/run all the targets (default). Otherwise, you can supply tidyselect helpers like any_of() and starts_with(). Because tar_make() and friends run the pipeline in a new R session, if you pass a character vector to a tidyselect helper, you will need to evaluate that character vector early with !!, e.g. tar_make(names = any_of(!!your_vector)). Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not to individual dynamic branches.

shortcut Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. It relies on stored metadata for information about upstream dependencies. shortcut = TRUE only works if you set names.

reporter Character of length 1, name of the reporter to user. Controls how messages are printed as targets run in the pipeline. Defaults to targets::tar_config_get("reporter_make"). Choices:

• "silent": print nothing.
• "summary": print a running total of the number of each targets in each status category (queued, dispatched, skipped, completed, canceled, or errored). Also show a timestamp ("%H:%M %OS2" strptime() format) of the last time the progress changed and printed to the screen.
• "timestamp": same as the "verbose" reporter except that each .message begins with a time stamp.
• "timestamp_positives": same as the "timestamp" reporter except without messages for skipped targets.
• "verbose": print messages for individual targets as they start, finish, or are skipped. Each individual target-specific time (e.g. "3.487 seconds") is strictly the elapsed runtime of the target and does not include steps like data retrieval and output storage.
• "verbose_positives": same as the "verbose" reporter except without messages for skipped targets.
seconds_meta_append
Positive numeric of length 1 with the minimum number of seconds between saves to the local metadata and progress files in the data store. Higher values generally make the pipeline run faster, but unsaved work (in the event of a crash) is not up to date. When the pipeline ends, all the metadata and progress data is saved immediately, regardless of seconds_meta_append.

seconds_meta_upload
Positive numeric of length 1 with the minimum number of seconds between uploads of the metadata and progress data to the cloud (see https://books.ropensci.org/targets/cloud-storage.html). Higher values generally make the pipeline run faster, but unsaved work (in the event of a crash) may not be backed up to the cloud. When the pipeline ends, all the metadata and progress data is uploaded immediately, regardless of seconds_meta_upload.

seconds_reporter
Positive numeric of length 1 with the minimum number of seconds between times when the reporter prints progress messages to the R console.

seconds_interval
Deprecated on 2023-08-24 (version 1.2.2.9001). Use seconds_meta_append, seconds_meta_upload, and seconds_reporter instead.

workers
Positive integer, number of persistent clustermq workers to create.

log_worker
Logical, whether to write a log file for each worker. Same as the log_worker argument of clustermq::Q() and clustermq::workers().

callr_function
A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments
A list of arguments to callr_function.

evir
An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The evir argument of tar_make() and related functions always overrides the current value of tar_option_get("evir") in the current R session just before running the target script file, so whenever you need to set an alternative evir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script
Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.
store

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

garbage_collection

Logical of length 1, whether to run garbage collection on the main process before sending a target to a worker. Independent from the `garbage_collection` argument of `tar_target()`, which controls garbage collection on the worker.

Details

tar_make_clustermq() is like `tar_make()` except that targets run in parallel on persistent workers. A persistent worker is an R process that runs for a long time and runs multiple targets during its lifecycle. Persistent workers launch as soon as the pipeline reaches an outdated target with `deployment = "worker"`, and they keep running until the pipeline starts to wind down.

To configure `tar_make_clustermq()`, you must configure the `clustermq` package. To do this, set global options `clustermq.scheduler` and `clustermq.template` inside the target script file (default: `_targets.R`). To read more about configuring clustermq for your scheduler, visit [https://mschubert.github.io/clustermq/articles/userguide.html#configuration](https://mschubert.github.io/clustermq/articles/userguide.html#configuration) or [https://books.ropensci.org/targets/hpc.html](https://books.ropensci.org/targets/hpc.html). `clustermq` is not a strict dependency of `targets`, so you must install `clustermq` yourself.

Value

`NULL` except if `callr_function = callr::r_bg()`, in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

Storage access

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as `tar_render()` and `tar_quarto()`.

Examples

```r
if (!identical(tolower(Sys.info()[["sysname"]]), "windows")) {
  if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
    tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
      tar_script({
        options(clustermq.scheduler = "multiprocess") # Does not work on Windows.
        tar_option_set()
        list(tar_target(x, 1 + 1))
      }, ask = FALSE)
      tar_make_clustermq()
    })
  }
}
```

**tar_make_future**

*Superseded. Run a pipeline of targets in parallel with transient future workers.*

### Description

Superseded. Use `tar_make()` with crew: [https://books.ropensci.org/targets/crew.html](https://books.ropensci.org/targets/crew.html).

### Usage

```r
tar_make_future(
  names = NULL,
  shortcut = targets::tar_config_get("shortcut"),
  reporter = targets::tar_config_get("reporter_make"),
  seconds_meta_append = targets::tar_config_get("seconds_meta_append"),
  seconds_meta_upload = targets::tar_config_get("seconds_meta_upload"),
  seconds_reporter = targets::tar_config_get("seconds_reporter"),
  seconds_interval = targets::tar_config_get("seconds_interval"),
  workers = targets::tar_config_get("workers"),
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function, reporter),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store"),
  garbage_collection = targets::tar_config_get("garbage_collection")
)
```

### Arguments

**names**

Names of the targets to run or check. Set to `NULL` to check/run all the targets (default). Otherwise, you can supply `tidyselect` helpers like `any_of()` and `starts_with()`. Because `tar_make()` and friends run the pipeline in a new R session, if you pass a character vector to a `tidyselect` helper, you will need to evaluate that character vector early with `!!`, e.g. `tar_make(names =`
any_of(!_your_vector)). Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not to individual dynamic branches.

**shortcut**
Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. It relies on stored metadata for information about upstream dependencies. shortcut = TRUE only works if you set names.

**reporter**
Character of length 1, name of the reporter to user. Controls how messages are printed as targets run in the pipeline. Defaults to tar_config_get("reporter_make"). Choices:

- "silent": print nothing.
- "summary": print a running total of the number of each targets in each status category (queued, dispatched, skipped, completed, canceled, or errored). Also show a timestamp ("%H:%M %OS2" strftime() format) of the last time the progress changed and printed to the screen.
- "timestamp": same as the "verbose" reporter except that each .message begins with a time stamp.
- "timestamp_positives": same as the "timestamp" reporter except without messages for skipped targets.
- "verbose": print messages for individual targets as they start, finish, or are skipped. Each individual target-specific time (e.g. "3.487 seconds") is strictly the elapsed runtime of the target and does not include steps like data retrieval and output storage.
- "verbose_positives": same as the "verbose" reporter except without messages for skipped targets.

**seconds_meta_append**
Positive numeric of length 1 with the minimum number of seconds between saves to the local metadata and progress files in the data store. Higher values generally make the pipeline run faster, but unsaved work (in the event of a crash) is not up to date. When the pipeline ends, all the metadata and progress data is saved immediately, regardless of seconds_meta_append.

**seconds_meta_upload**
Positive numeric of length 1 with the minimum number of seconds between uploads of the metadata and progress data to the cloud (see https://books.ropensci.org/targets/cloud-storage.html). Higher values generally make the pipeline run faster, but unsaved work (in the event of a crash) may not be backed up to the cloud. When the pipeline ends, all the metadata and progress data is uploaded immediately, regardless of seconds_meta_upload.

**seconds_reporter**
Positive numeric of length 1 with the minimum number of seconds between times when the reporter prints progress messages to the R console.

**seconds_interval**
Deprecated on 2023-08-24 (version 1.2.2.9001). Use seconds_meta_append, seconds_meta_upload, and seconds_reporter instead.
workers Positive integer, maximum number of transient future workers allowed to run at any given time.

callr_function A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments A list of arguments to callr_function.

envir An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

garbage_collection Logical of length 1, whether to run garbage collection on the main process before sending a target to a worker. Independent from the garbage_collection argument of tar_target(), which controls garbage collection on the worker.

Details

This function is like tar_make() except that targets run in parallel with transient future workers. It requires that you declare your future::plan() inside the target script file (default: _targets.R). future is not a strict dependency of targets, so you must install future yourself.

To configure tar_make_future() with a computing cluster, see the future.batchtools package documentation.

Value

NULL except if callr_function = callr::r_bg(), in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.
Storage access

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

Other pipeline: `tar_make()`, `tar_make_clustermq()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(
  future::plan(future::multisession, workers = 2)
  list(
    tar_target(x, 1 + 1),
    tar_target(y, 1 + 1)
  )
}, ask = FALSE)
tar_make_future()
})
}
```

---

**tar_manifest**  
*Produce a data frame of information about your targets.*

**Description**

Along with `tar_visnetwork()` and `tar_glimpse()`, `tar_manifest()` helps check that you constructed your pipeline correctly.

**Usage**

```r
tar_manifest(
  names = NULL,
  fields = tidyselect::any_of(c("name", "command", "pattern")),
  drop_missing = TRUE,
)```

callr_function = callr::r,
callr_arguments = targets::tar_callr_args_default(callr_function),
envir = parent.frame(),
script = targets::tar_config_get("script")
)

Arguments

names Names of the targets to show. Set to NULL to show all the targets (default). Otherwise, you can supply symbols, a character vector, or tidyselect helpers like any_of() and starts_with().

fields Names of the fields, or columns, to show. Set to NULL to show all the fields (default). Otherwise, you can supply tidyselect helpers like starts_with(). Set to NULL to print all the fields. The name of the target is always included as the first column regardless of the selection. Possible fields are below. All of them can be set in tar_target(), tar_target_raw(), or tar_option_set().
   • name: Name of the target.
   • command: the R command that runs when the target runs.
   • pattern: branching pattern of the target, if applicable.
   • format: Storage format.
   • repository: Storage repository.
   • iteration: Iteration mode for branching.
   • error: Error mode, what to do when the target fails.
   • memory: Memory mode, when to keep targets in memory.
   • storage: Storage mode for high-performance computing scenarios.
   • retrieval: Retrieval mode for high-performance computing scenarios.
   • deployment: Where/whether to deploy the target in high-performance computing scenarios.
   • priority: Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get dispatched earlier (and polled earlier in tar_make_future()).
   • resources: A list of target-specific resource requirements for tar_make_future().
   • cue_mode: Cue mode from tar_cue().
   • cue_depend: Depend cue from tar_cue().
   • cue_expr: Command cue from tar_cue().
   • cue_file: File cue from tar_cue().
   • cue_format: Format cue from tar_cue().
   • cue_repository: Repository cue from tar_cue().
   • cue_iteration: Iteration cue from tar_cue().
   • packages: List columns of packages loaded before running the target.
   • library: List column of library paths to load the packages.

drop_missing Logical of length 1, whether to automatically omit empty columns and columns with all missing values.
callr_function A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments A list of arguments to callr_function.

envir An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

Value

A data frame of information about the targets in the pipeline. Rows appear in topological order (the order they will run without any influence from parallel computing or priorities).

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto()

Other inspect: `tar_deps()`, `tar_deps_raw()`, `tar_network()`, `tar_outdated()`, `tar_sitrep()`, `tar_validate()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    tar_script(
      tar_option_set(
        list(
          tar_target(y1, 1 + 1),
          tar_target(y2, 1 + 1),
          tar_target(z, y1 + y2),
          tar_target(m, z, pattern = map(z)),
          tar_target(c, z, pattern = cross(z))
        )
      ), ask = FALSE)
    tar_manifest()
    tar_manifest(fields = c("name", "command"))
    tar_manifest(fields = "command")
    tar_manifest(fields = starts_with("cue"))
  })
}
```

tar_mermaid

---

tar_mermaid mermaid.js dependency graph.

Description

Visualize the dependency graph with a static mermaid.js graph.

Usage

```r
tar_mermaid(
  targets_only = FALSE,
  names = NULL,
  shortcut = FALSE,
  allow = NULL,
  exclude = ".Random.seed",
  outdated = TRUE,
  label = NULL,
  legend = TRUE,
  color = TRUE,
  reporter = targets::tar_config_get("reporter_outdated"),
  seconds_reporter = targets::tar_config_get("seconds_reporter"),
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function),
)```
envir = parent.frame(),
script = targets::tar_config_get("script"),
store = targets::tar_config_get("store")
)

Arguments

targets_only Logical, whether to restrict the output to just targets (FALSE) or to also include
global functions and objects.

names Names of targets. The graph visualization will operate only on these targets
(and unless shortcut is TRUE, all the targets upstream as well). Selecting a
small subgraph using names could speed up the load time of the visualization.
Unlike allow, names is invoked before the graph is generated. Set to NULL to
check/run all the targets (default). Otherwise, you can supply symbols or tidys-
elect helpers like starts_with(). Applies to ordinary targets (stem) and whole
dynamic branching targets (patterns) but not individual dynamic branches.

shortcut Logical of length 1, how to interpret the names argument. If shortcut is FALSE
(default) then the function checks all targets upstream of names as far back as
the dependency graph goes. If TRUE, then the function only checks the targets in
names and uses stored metadata for information about upstream dependencies as
needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets,
but it assumes all the dependencies are up to date, so please use with caution.
Also, shortcut = TRUE only works if you set names.

allow Optional, define the set of allowable vertices in the graph. Unlike names, allow
is invoked only after the graph is mostly resolved, so it will not speed up execu-
tion. Set to NULL to allow all vertices in the pipeline and environment (default).
Otherwise, you can supply symbols or tidyselect helpers like starts_with().

exclude Optional, define the set of exclude vertices from the graph. Unlike names, exclude
is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to exclude no vertices. Otherwise, you can supply
symbols or tidyselect helpers like any_of() and starts_with().

outdated Logical, whether to show colors to distinguish outdated targets from up-to-date
targets. (Global functions and objects still show these colors.) Looking for
outdated targets takes a lot of time for large pipelines with lots of branches, and
setting outdated to FALSE is a nice way to speed up the graph if you only want
to see dependency relationships and pipeline progress.

label Character vector of one or more aesthetics to add to the vertex labels. Can
contain "time" to show total runtime, "size" to show total storage size, or
"branches" to show the number of branches in each pattern. You can choose
multiple aesthetics at once, e.g. label = c("time", "branches"). All are dis-
abled by default because they clutter the graph.

legend Logical of length 1, whether to display the legend.

color Logical of length 1, whether to color the graph vertices by status.

reporter Character of length 1, name of the reporter to user. Controls how messages are
printed as targets are checked. Choices:
  • "silent": print nothing.
- "forecast": print running totals of the checked and outdated targets found so far.

seconds_reporter
Positive numeric of length 1 with the minimum number of seconds between times when the reporter prints progress messages to the R console.

callr_function
A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments
A list of arguments to callr_function.

envir
An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.
The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script
Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

store
Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details
mermaid.js is a JavaScript library for constructing static visualizations of graphs.

Value
A character vector of lines of code of the mermaid.js graph. You can visualize the graph by copying the text into a public online mermaid.js editor or a mermaid GitHub code chunk (https://github.blog/2022-02-14-include-diagrams-markdown-files-mermaid/).
Alternatively, you can render it inline in an R Markdown or Quarto document using a results = "asis" code chunk like so:
```
```
Dependency graph

The dependency graph of a pipeline is a directed acyclic graph (DAG) where each node indicates a target or global object and each directed edge indicates where a downstream node depends on an upstream node. The DAG is not always a tree, but it never contains a cycle because no target is allowed to directly or indirectly depend on itself. The dependency graph should show a natural progression of work from left to right. targets uses static code analysis to create the graph, so the order of tar_target() calls in the _targets.R file does not matter. However, targets does not support self-referential loops or other cycles. For more information on the dependency graph, please read https://books.ropensci.org/targets/targets.html#dependencies.

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

Examples

if (identical(Sys.getenv("TAR_INTERACTIVE_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      tar_option_set()
      list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
        tar_target(z, y1 + y2)
      )
    })
  # Copy the text into a mermaid.js online editor
  # or a mermaid GitHub code chunk:
  tar_mermaid()
})
}
tar_meta

Read a project’s metadata.

Description

Read the metadata of all recorded targets and global objects.

Usage

tar_meta(
  names = NULL,
  fields = NULL,
  targets_only = FALSE,
  complete_only = FALSE,
  store = targets::tar_config_get("store")
)

Arguments

- **names**: Optional, names of the targets. If supplied, `tar_meta()` only returns metadata on these targets. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`. If NULL, all names are selected.

- **fields**: Optional, names of columns/fields to select. If supplied, `tar_meta()` only returns the selected metadata columns. If NULL, all fields are selected. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`. The `name` column is always included first no matter what you select. Choices:
  - **name**: name of the target or global object.
  - **type**: type of the object: either "function" or "object" for global objects, and "stem", "branch", "map", or "cross" for targets.
  - **data**: hash of the output data.
  - **command**: hash of the target's deparsed command.
  - **depend**: hash of the immediate upstream dependencies of the target.
  - **seed**: random number generator seed with which the target ran. A target’s random number generator seed is a deterministic function of its name. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `tar_seed_set()` on the result to locally recreate the target’s initial RNG state.
  - **path**: A list column of paths to target data. Usually, each element is a single path, but there could be multiple paths per target for dynamic files (i.e. `tar_target(format = "file")`).
• time: POSIXct object with the time the target's data in storage was last modified. If the target stores no local file, then the time stamp corresponds to the time the target last ran successfully. Only targets that run commands have time stamps: just non-branching targets and individual dynamic branches. Displayed in the current time zone of the system. If there are multiple outputs for that target, as with file targets, then the maximum time is shown.

• size: hash of the sum of all the bytes of the files at path.

• bytes: total file size in bytes of all files in path.

• format: character, one of the admissible data storage formats. See the format argument in the tar_target() help file for details.

• iteration: character, either "list" or "vector" to describe the iteration and aggregation mode of the target. See the iteration argument in the tar_target() help file for details.

• parent: for branches, name of the parent pattern.

• children: list column, names of the children of targets that have them. These include buds of stems and branches of patterns.

• seconds: number of seconds it took to run the target.

• warnings: character string of warning messages from the last run of the target. Only the first 50 warnings are available, and only the first 2048 characters of the concatenated warning messages.

• error: character string of the error message if the target errored.

tar_meta

• targets_only: Logical, whether to just show information about targets or also return metadata on functions and other global objects.

• complete_only: Logical, whether to return only complete rows (no NA values).

• store: Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

A metadata row only updates when the target completes. tar_progress() shows information on targets that are running. That is why the number of branches may disagree between tar_meta() and tar_progress() for actively running pipelines.

Value

A data frame with one row per target/object and the selected fields.

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running
pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

### Cloud metadata

Metadata files help targets read data objects and decide if the pipeline is up to date. Usually, these metadata files live in files in the local `_targets/meta/` folder in your project, e.g. `_targets/meta/meta`. But in addition, if you set `repository` to anything other than "local" in `tar_option_set()` in `_targets.R`, then `tar_make()` continuously uploads the metadata files to the bucket you specify in `resources`. `tar_meta_delete()` will delete those files from the cloud, and so will `tar_destroy()` if destroy is set to either "all" or "cloud".

Other functions in targets, such as `tar_meta()`, `tar_visnetwork()`, `tar_outdated()`, and `tar_invalidate()`, use the local metadata only and ignore the copies on the cloud. So if you are working on a different computer than the one running the pipeline, you will need to download the cloud metadata to your current machine using `tar_meta_download()`. Other functions `tar_meta_upload()`, `tar_meta_sync()`, and `tar_meta_delete()` also manage metadata across the cloud and the local file system.

Remarks:

- The `repository_meta` option in `tar_option_set()` is actually what controls where the metadata lives in the cloud, but it defaults to `repository`.
- Like `tar_make()`, `tar_make_future()` and `tar_make_clustermq()` also continuously upload metadata files to the cloud bucket specified in `resources`.
- `tar_meta_download()` and related functions need to run `_targets.R` to detect `tar_option_set()` options `repository_meta` and `resources`, so please be aware of side effects that may happen running your custom `_targets.R` file.

### See Also

Other metadata: `tar_meta_delete()`, `tar_meta_download()`, `tar_meta_sync()`, `tar_meta_upload()`

### Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
    list(
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
    )
}, ask = FALSE)
tar_make()
tar_meta()
```

Delete metadata.

Delete the project metadata files from the local file system, the cloud, or both.

Usage

```r
tar_meta_delete(
  meta = TRUE,
  progress = TRUE,
  process = TRUE,
  crew = TRUE,
  verbose = TRUE,
  delete = "all",
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```

Arguments

- **meta**: Logical of length 1, whether to process the main metadata file at `_targets/meta/meta`.
- **progress**: Logical of length 1, whether to process the progress file at `_targets/meta/progress`.
- **process**: Logical of length 1, whether to process the process file at `_targets/meta/process`.
- **crew**: Logical of length 1, whether to process the crew file at `_targets/meta/crew`. Only exists if running `targets` with `crew`.
- **verbose**: Logical of length 1, whether to print informative console messages.
- **delete**: Character of length 1, which location to delete the files. Choose "local" for local files, "cloud" for files on the cloud, or "all" to delete metadata files from both the local file system and the cloud.
- **script**: Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.
See Also

Other metadata: `tar_meta()`, `tar_meta_download()`, `tar_meta_sync()`, `tar_meta_upload()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      }, ask = FALSE)
    tar_make()
    tar_meta_delete()
  })
}
```

```
```

`tar_meta_download` download local metadata to the cloud.

Description

download local metadata files to the cloud location (repository, bucket, and prefix) you set in `tar_option_set()` in `_targets.R`.

Usage

```r
tar_meta_download(
  meta = TRUE,
  progress = TRUE,
  process = TRUE,
  crew = TRUE,
  verbose = TRUE,
  strict = FALSE,
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```

Arguments

- `meta` Logical of length 1, whether to process the main metadata file at `_targets/meta/meta`.
- `progress` Logical of length 1, whether to process the progress file at `_targets/meta/progress`.
- `process` Logical of length 1, whether to process the process file at `_targets/meta/process`.
- `crew` Logical of length 1, whether to process the crew file at `_targets/meta/crew`. Only exists if running targets with crew.
- `verbose` Logical of length 1, whether to print informative console messages.
- `strict` Logical of length 1. TRUE to error out if the file does not exist in the bucket, FALSE to proceed without an error or warning. If `strict` is FALSE and `verbose` is TRUE, then an informative message will print to the R console.
**Description**

Synchronize metadata in a cloud bucket with metadata in the local data store.

**Usage**

```r
tar_meta_sync(
  meta = TRUE,
  progress = TRUE,
  process = TRUE,
  crew = TRUE,
  verbose = TRUE,
  prefer_local = TRUE,
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```

**See Also**

Other metadata: `tar_meta()`, `tar_meta_delete()`, `tar_meta_sync()`, `tar_meta_upload()`
Arguments

- **meta**: Logical of length 1, whether to process the main metadata file at `_targets/meta/meta`.
- **progress**: Logical of length 1, whether to process the progress file at `_targets/meta/progress`.
- **process**: Logical of length 1, whether to process the process file at `_targets/meta/process`.
- **crew**: Logical of length 1, whether to process the crew file at `_targets/meta/crew`. Only exists if running targets with crew.
- **verbose**: Logical of length 1, whether to print informative console messages.
- **prefer_local**: Logical of length 1 to control which copy of each metadata file takes precedence if the local hash and cloud hash are different but the time stamps are the same. Set to TRUE to upload the local data file in that scenario, FALSE to download the cloud file.
- **script**: Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

tar_meta_sync() synchronizes the local and cloud copies of all the metadata files of the pipeline so that both have the most recent copy. For each metadata file, if the local file does not exist or is older than the cloud file, then the cloud file is downloaded to the local file path. Conversely, if the cloud file is older or does not exist, then the local file is uploaded to the cloud. If the time stamps of these files are equal, use the prefer_local argument to determine which copy takes precedence.

See Also

Other metadata: `tar_meta()`, `tar_meta_delete()`, `tar_meta_download()`, `tar_meta_upload()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
}, ask = FALSE)
tar_make()
tar_meta_sync()
})
}
```
**Description**

Upload local metadata files to the cloud location (repository, bucket, and prefix) you set in `tar_option_set()` in `_targets.R`.

**Usage**

```r
tar_meta_upload(
  meta = TRUE,
  progress = TRUE,
  process = TRUE,
  crew = TRUE,
  verbose = TRUE,
  strict = FALSE,
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```

**Arguments**

- `meta`: Logical of length 1, whether to process the main metadata file at `_targets/meta/meta`.
- `progress`: Logical of length 1, whether to process the progress file at `_targets/meta/progress`.
- `process`: Logical of length 1, whether to process the process file at `_targets/meta/process`.
- `crew`: Logical of length 1, whether to process the `crew` file at `_targets/meta/crew`.
  
  Only exists if running `targets` with `crew`.
- `verbose`: Logical of length 1, whether to print informative console messages.
- `strict`: Logical of length 1. TRUE to error out if the file does not exist locally, FALSE to proceed without an error or warning. If `strict` is FALSE and `verbose` is TRUE, then an informative message will print to the R console.
- `script`: Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.
- `store`: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

tar_script({
}, ask = FALSE)
tar_make()
tar_meta_upload()
})
}

tar_name

Get the name of the target currently running.

Description

Get the name of the target currently running.

Usage

tar_name(default = "target")

Arguments

default Character, value to return if tar_name() is called on its own outside a targets pipeline. Having a default lets users run things without tar_make(), which helps peel back layers of code and troubleshoot bugs.

Value

Character of length 1. If called inside a pipeline, tar_name() returns name of the target currently running. Otherwise, the return value is default.

See Also

Other utilities: tar_active(), tar_backoff(), tar_call(), tar_cancel(), tar_definition(), tar_envir(), tar_group(), tar_path(), tar_path_script(), tar_path_script_support(), tar_path_store(), tar_path_target(), tar_source(), tar_store()

Examples

tar_name()
tar_name(default = "custom_target_name")
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(tar_target(x, tar_name()), ask = FALSE)
tar_make()
tar_read(x)
})
}
Return the vertices and edges of a pipeline dependency graph.

**Description**

Analyze the pipeline defined in the target script file (default: `_targets.R`) and return the vertices and edges of the directed acyclic graph of dependency relationships.

**Usage**

```r
tar_network(
  targets_only = FALSE,
  names = NULL,
  shortcut = FALSE,
  allow = NULL,
  exclude = NULL,
  outdated = TRUE,
  reporter = targets::tar_config_get("reporter_outdated"),
  seconds_reporter = targets::tar_config_get("seconds_reporter"),
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function, reporter),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
```

**Arguments**

- `targets_only` Logical, whether to restrict the output to just targets (FALSE) or to also include imported global functions and objects.

- `names` Names of targets. The graph visualization will operate only on these targets (and unless shortcut is TRUE, all the targets upstream as well). Selecting a small subgraph using names could speed up the load time of the visualization. Unlike allow, names is invoked before the graph is generated. Set to NULL to check/run all the targets (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with(). Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not individual dynamic branches.

- `shortcut` Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Also, shortcut = TRUE only works if you set names.
Optional, define the set of allowable vertices in the graph. Unlike names, allow is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to allow all vertices in the pipeline and environment (default). Otherwise, you can supply symbols or tidyselect helpers like `starts_with()`.

Optional, define the set of exclude vertices from the graph. Unlike names, exclude is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to exclude no vertices. Otherwise, you can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`.

Logical, whether to show colors to distinguish outdated targets from up-to-date targets. (Global functions and objects still show these colors.) Looking for outdated targets takes a lot of time for large pipelines with lots of branches, and setting outdated to FALSE is a nice way to speed up the graph if you only want to see dependency relationships and pipeline progress.

Character of length 1, name of the reporter to user. Controls how messages are printed as targets are checked. Choices:

- "silent": print nothing.
- "forecast": print running totals of the checked and outdated targets found so far.

Positive numeric of length 1 with the minimum number of seconds between times when the reporter prints progress messages to the R console.

A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be NULL for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be NULL for serious reproducible work.

A list of arguments to `callr_function`.

An environment, where to run the target R script (default: `_targets.R`) if `callr_function` is NULL. Ignored if `callr_function` is anything other than NULL. `callr_function` should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir`, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then `envir2` will be used.

Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.
store

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

A list with two data frames: vertices and edges. The vertices data frame has one row per target with fields to denote the type of the target or object (stem, branch, map, cross, function, or object) and the target’s status (up to date, outdated, dispatched, completed, canceled, or errored). The edges data frame has one row for every edge and columns to and from to mark the starting and terminating vertices.

**Dependency graph**

The dependency graph of a pipeline is a directed acyclic graph (DAG) where each node indicates a target or global object and each directed edge indicates where a downstream node depends on an upstream node. The DAG is not always a tree, but it never contains a cycle because no target is allowed to directly or indirectly depend on itself. The dependency graph should show a natural progression of work from left to right. targets uses static code analysis to create the graph, so the order of `tar_target()` calls in the `_targets.R` file does not matter. However, targets does not support self-referential loops or other cycles. For more information on the dependency graph, please read https://books.ropensci.org/targets/targets.html#dependencies.

**See Also**

Other inspect: `tar_deps()`, `tar_deps_raw()`, `tar_manifest()`, `tar_outdated()`, `tar_sitrep()`, `tar_validate()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  tar_option_set()
  list(
    tar_target(y1, 1 + 1),
    tar_target(y2, 1 + 1),
    tar_target(z, y1 + y2)
  )
}, ask = FALSE)
tar_network(targets_only = TRUE)
})
```
List new targets

Description

List all the targets whose last successful run occurred after a certain point in time.

Usage

tar_newer(
  time,
  names = NULL,
  inclusive = FALSE,
  store = targets::tar_config_get("store")
)

Arguments

time  
A POSIXct object of length 1, time threshold. Targets newer than this time stamp are returned. For example, if time = Sys.time - as.difftime(1, units = "weeks") then tar_newer() returns targets newer than one week ago.

names  
Names of eligible targets. Targets excluded from names will not be returned even if they are newer than the given time. You can supply symbols or tidyselect helpers like any_of() and starts_with(). If NULL, all names are eligible.

inclusive  
Logical of length 1, whether to include targets completed at exactly the time given.

store  
Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

Only applies to targets with recorded time stamps: just non-branching targets and individual dynamic branches. As of targets version 0.6.0, these time stamps are available for these targets regardless of storage format. Earlier versions of targets do not record time stamps for remote storage such as format = "url" or repository = "aws" in tar_target().

Value

A character vector of names of old targets with recorded timestamp metadata.

See Also

Other time: tar_older(), tar_timestamp(), tar_timestamp_raw()
**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(tar_target(x, seq_len(2)))
}, ask = FALSE)
tar_make()
# targets newer than 1 week ago
  tar_newer(Sys.time() - as.difftime(1, units = "weeks"))
# targets newer than 1 week from now
  tar_newer(Sys.time() + as.difftime(1, units = "weeks"))
# Everything is still up to date.
  tar_make()
# Invalidate all targets targets newer than 1 week ago
# so they run on the next tar_make().
  invalidate_these <- tar_newer(Sys.time() - as.difftime(1, units = "weeks"))
  tar_invalidate(any_of(invalid_these))
  tar_make()
})
}
```

---

**tar_noninteractive**  
*Run if Target Markdown interactive mode is not on.*

**Description**

In Target Markdown, run the enclosed code only if interactive mode is not activated. Otherwise, do not run the code.

**Usage**

```r
tar_noninteractive(code)
```

**Arguments**

- **code**  
  R code to run if Target Markdown interactive mode is not turned on.

**Details**

Visit <books.ropensci.org/targets/literate-programming.html> to learn about Target Markdown and interactive mode.

**Value**

If Target Markdown interactive mode is not turned on, the function returns the result of running the code. Otherwise, the function invisibly returns `NULL`.

**See Also**

Other Target Markdown: `tar_engine_knitr()`, `tar_interactive()`, `tar_toggle()`
Examples

tar_noninteractive(message("Not in interactive mode."))

```
examples

Description
List targets currently saved to _targets/objects/ or the cloud. Does not include local files with
tar_target(..., format = "file", repository = "local").

Usage

tar_objects(
  names = NULL,
  cloud = TRUE,
  store = targets::tar_config_get("store")
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>Optional tidyselect selector such as any_of() or starts_with() to return a tactical subset of target names. If NULL, all names are selected.</td>
</tr>
<tr>
<td>cloud</td>
<td>Logical of length 1, whether to include cloud targets in the output (e.g. tar_target(..., repository = &quot;aws&quot;).</td>
</tr>
<tr>
<td>store</td>
<td>Character of length 1, path to the targets data store. Defaults to tar_config_get(&quot;store&quot;), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get(&quot;store&quot;) is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.</td>
</tr>
</tbody>
</table>

Value

Character vector of targets saved to _targets/objects/.

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets
can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

Other data: tar_crew(), tar_load(), tar_load_everything(), tar_load_raw(), tar_pid(), tar_process(), tar_read(), tar_read_raw()

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {  # for CRAN
tar_dir({  # tar_dir() runs code from a temp dir for CRAN.
tar_script({
    list(tar_target(x, "value"))
}, ask = FALSE)
tar_make()
tar_objects()
tar_objects(starts_with("x"))  # see also any_of()
})
}
```

---

tar_older

List old targets

Description

List all the targets whose last successful run occurred before a certain point in time. Combine with tar_invalidate(), you can use tar_older() to automatically rerun targets at regular intervals. See the examples for a demonstration.

Usage

```r
tar_older(
    time,
    names = NULL,
    inclusive = FALSE,
    store = targets::tar_config_get("store")
)
```

Arguments

time A POSIXct object of length 1, time threshold. Targets older than this time stamp are returned. For example, if `time = Sys.time() - as.difftime(1, units = "weeks")` then `tar_older()` returns targets older than one week ago.

names Names of eligible targets. Targets excluded from names will not be returned even if they are old. You can supply symbols or tidyselect helpers like any_of() and starts_with(). If NULL, all names are eligible.
inclusive Logical of length 1, whether to include targets completed at exactly the time given.

store Character of length 1, path to the targets data store. Defaults to \texttt{tar_config_get("store")}, which in turn defaults to \_targets\/. When you set this argument, the value of \texttt{tar_config_get("store")} is temporarily changed for the current function call. See \texttt{tar_config_get()} and \texttt{tar_config_set()} for details about how to set the data store path persistently for a project.

Details

Only applies to targets with recorded time stamps: just non-branching targets and individual dynamic branches. As of \texttt{targets} version 0.6.0, these time stamps are available for these targets regardless of storage format. Earlier versions of \texttt{targets} do not record time stamps for remote storage such as \texttt{format = "url"} or \texttt{repository = "aws"} in \texttt{tar_target()}.

Value

A character vector of names of old targets with recorded timestamp metadata.

See Also

Other time: \texttt{tar_newer()}, \texttt{tar_timestamp()}, \texttt{tar_timestamp_raw()}

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(tar_target(x, seq_len(2)))
}, ask = FALSE)
tar_make()
# targets older than 1 week ago
tar_older(Sys.time() - as.difftime(1, units = "weeks"))
# targets older than 1 week from now
tar_older(Sys.time() + as.difftime(1, units = "weeks"))
# Everything is still up to date.
tar_make()
# Invalidate all targets targets older than 1 week from now
# so they run on the next tar_make().
invalidate_these <- tar_older(Sys.time() + as.difftime(1, units = "weeks"))
tar_invalidate(any_of(invalidate_these))
tar_make()
})
}
Get a target option.

Description

Get a target option. These options include default arguments to `tar_target()` such as packages, storage format, iteration type, and cue. Needs to be called before any calls to `tar_target()` in order to take effect.

Usage

```r
 tar_option_get(name = NULL, option = NULL)
```

Arguments

- `name`: Character of length 1, name of an option to get. Must be one of the argument names of `tar_option_set()`.
- `option`: Deprecated, use the `name` argument instead.

Details

This function goes well with `tar_target_raw()` when it comes to defining external interfaces on top of the targets package to create pipelines.

Value

Value of a target option.

See Also

Other configuration: `tar_config_get()`, `tar_config_projects()`, `tar_config_set()`, `tar_config_unset()`, `tar_config_yaml()`, `tar_envvars()`, `tar_option_reset()`, `tar_option_set()`

Examples

```r
tar_option_get("format") # default format before we set anything
tar_target(x, 1)$settings$format
tar_option_set(format = "fst_tbl") # new default format
tar_option_get("format")
tar_target(x, 1)$settings$format
tar_option_reset() # reset the format
tar_target(x, 1)$settings$format
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
tar_option_set(cue = tar_cue(mode = "always")) # All targets always run.
list(tar_target(x, 1), tar_target(y, 2))
})
tar_make()
```
tar_option_reset

Reset all target options.

Description
Reset all target options you previously chose with tar_option_set(). These options are mostly configurable default arguments to tar_target() and tar_target_raw().

Usage
tar_option_reset()

Value
NULL (invisibly).

See Also
Other configuration: tar_config_get(), tar_config_projects(), tar_config_set(), tar_config_unset(), tar_config_yaml(), tar_envvars(), tar_option_get(), tar_option_set()

Examples
tar_option_get("format") # default format before we set anything
tar_target(x, 1)$settings$format
tar_option_set(format = "fst_tbl") # new default format
tar_option_get("format")
tar_target(x, 1)$settings$format
tar_option_reset() # reset all options
tar_target(x, 1)$settings$format
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
    tar_option_set(cue = tar_cue(mode = "always"))
    tar_option_reset() # Undo option above.
    list(tar_target(x, 1), tar_target(y, 2))
})
tar_make()
tar_make()
})
}
Description

Set target options, including default arguments to `tar_target()` such as packages, storage format, iteration type, and cue. Only the non-null arguments are actually set as options. See currently set options with `tar_option_get()`. To use `tar_option_set()` effectively, put it in your workflow’s target script file (default: `_targets.R`) before calls to `tar_target()` or `tar_target_raw()`.

Usage

```r
tar_option_set(
  tidy_eval = NULL,
  packages = NULL,
  imports = NULL,
  library = NULL,
  envir = NULL,
  format = NULL,
  repository = NULL,
  repository_meta = NULL,
  iteration = NULL,
  error = NULL,
  memory = NULL,
  garbage_collection = NULL,
  deployment = NULL,
  priority = NULL,
  backoff = NULL,
  resources = NULL,
  storage = NULL,
  retrieval = NULL,
  cue = NULL,
  debug = NULL,
  workspaces = NULL,
  workspace_on_error = NULL,
  seed = NULL,
  controller = NULL,
  trust_object_timestamps = NULL
)
```

Arguments

- `tidy_eval` Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the “bang-bang” operator `!!` to programmatically insert the values of global objects.
packages  Character vector of packages to load right before the target runs or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

imports  Character vector of package names. For every package listed, targets tracks every dataset and every object in the package namespace as if it were part of the global namespace. As an example, say you have a package called `customAnalysisPackage` which contains an object called `analysis_function()`. If you write `tar_option_set(imports = "yourAnalysisPackage")` in your target script file (default: `_targets.R`), then a function called "analysis_function" will show up in the `tar_visnetwork()` graph, and any targets or functions referring to the symbol "analysis_function" will depend on the function `analysis_function()` from package `yourAnalysisPackage`. This is best combined with `tar_option_set(packages = "yourAnalysisPackage")` so that `analysis_function()` can actually be called in your code.

There are several important limitations: 1. Namespaced calls, e.g. `yourAnalysisPackage::analysis_function()` are ignored because of the limitations in `codetools::findGlobals()` which powers the static code analysis capabilities of targets. 2. The imports option only looks at R objects and R code. It not account for low-level compiled code such as C/C++ or Fortran. 3. If you supply multiple packages, e.g. `tar_option_set(imports = c("p1", "p2"))`, then the objects in `p1` override the objects in `p2` if there are name conflicts. 4. Similarly, objects in `tar_option_get("envir")` override everything in `tar_option_get("imports")`.

library  Character vector of library paths to try when loading packages.

eenvir  Environment containing functions and global objects common to all targets in the pipeline. The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir`, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then `envir2` will be used.

If `envir` is the global environment, all the promise objects are diffused before sending the data to parallel workers in `tar_make_future()` and `tar_make_clustermq()`, but otherwise the environment is unmodified. This behavior improves performance by decreasing the size of data sent to workers.

If `envir` is not the global environment, then it should at least inherit from the global environment or base environment so targets can access attached packages. In the case of a non-global `envir`, targets attempts to remove potentially high memory objects that come directly from targets. That includes `tar_target()` objects of class "tar_target", as well as objects of class "tar_pipeline" or "tar_algorithm". This behavior improves performance by decreasing the size of data sent to workers.

Package environments should not be assigned to `envir`. To include package objects as upstream dependencies in the pipeline, assign the package to the packages and imports arguments of `tar_option_set()`.

format  Optional storage format for the target’s return value. With the exception of `format = "file"`, each target gets a file in `_targets/objects`, and each format
is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

**repository** Character of length 1, remote repository for target storage. Choices:
- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for instructions.

Note: if `repository` is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

**repository_meta** Character of length 1 with the same values as `repository` ("aws", "gcp", "local"). Cloud repository for the metadata text files in _targets/meta/, including target metadata and progress data. Defaults to `tar_option_get("repository")`.

**iteration** Character of length 1, name of the iteration mode of the target. Choices:
- "vector": branching happens with `vctrs::vec_slice()` and aggregation happens with `vctrs::vec_c()`.
- "list", branching happens with `[[ ]]` and aggregation happens with `list()`.
- "group": `dplyr::group_by()`-like functionality to branch over subsets of a non-dynamic data frame. For `iteration = "group"`, the target must not by dynamic (the `pattern` argument of `tar_target()` must be left NULL). The target’s return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with `dplyr::group_by()`.

**error** Character of length 1, what to do if the target stops and throws an error. Options:
- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
- "abridge": any currently running targets keep running, but no new targets launch after that. (Visit [https://books.ropensci.org/targets/debugging.html](https://books.ropensci.org/targets/debugging.html) to learn how to debug targets using saved workspaces.)
- "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

**memory** Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded
after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

**garbage_collection**

Logical, whether to run `base::gc()` just before the target runs.

**deployment**

Character of length 1. If deployment is "main", then the target will run on the central controlling R process. Otherwise, if deployment is "worker" and you set up the pipeline with distributed/parallel computing, then the target runs on a parallel worker. For more on distributed/parallel computing in targets, please visit [https://books.ropensci.org/targets/crew.html](https://books.ropensci.org/targets/crew.html).

**priority**

Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get dispatched earlier (and polled earlier in `tar_make_future()`).

**backoff**

An object from `tar_backoff()` configuring the exponential backoff algorithm of the pipeline. See `tar_backoff()` for details. A numeric argument for `backoff` is still allowed, but deprecated.

**resources**

Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

**storage**

Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target’s command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to the data store from inside the target. The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically try to load the data from the data store as a dependency. As a corollary, storage = "none" is completely unnecessary if format is "file".

**retrieval**

Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target runs.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

cue
An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

debug
Character vector of names of targets to run in debug mode. To use effectively, you must set `callr_function = NULL` and restart your R session just before running. You should also `tar_make()`, `tar_make_clustermq()`, or `tar_make_future()`. For any target mentioned in debug, targets will force the target to run locally (with `tar_cue(mode = "always")` and `deployment = "main"` in the settings) and pause in an interactive debugger to help you diagnose problems. This is like inserting a `browser()` statement at the beginning of the target’s expression, but without invalidating any targets.

workspaces
Character vector of target names. Could be non-branching targets, whole dynamic branching targets, or individual branch names. `tar_make()` and friends will save workspace files for these targets even if the targets are skipped. Workspace files help with debugging. See `tar_workspace()` for details about workspaces.

workspace_on_error
Logical of length 1, whether to save a workspace file for each target that throws an error. Workspace files help with debugging. See `tar_workspace()` for details about workspaces.

seed
Integer of length 1, seed for generating target-specific pseudo-random number generator seeds. These target-specific seeds are deterministic and depend on `tar_option_get("seed")` and the target name. Target-specific seeds are safely and reproducibly applied to each target's command, and they are stored in the metadata and retrievable with `tar_meta()` or `tar_seed()`.

Either the user or third-party packages built on top of targets may still set seeds inside the command of a target. For example, some target factories in the tarchetypes package assigns replicate-specific seeds for the purposes of reproducible within-target batched replication. In cases like these, the effect of the target-specific seed saved in the metadata becomes irrelevant and the seed defined in the command applies.

The seed option can also be `NA` to disable automatic seed-setting. Any targets defined while `tar_option_get("seed")` is `NA` will not set a seed. In this case, those targets will never be up to date unless they have `cue = tar_cue(seed = FALSE)`.

controller
A controller or controller group object produced by the `crew` R package. `crew` brings auto-scaled distributed computing to `tar_make()`.

trust_object_timestamps
Logical of length 1, whether to use file system modification timestamps to check whether the target output data files in `_targets/objects/` are up to date. This is an advanced setting and usually does not need to be set by the user except on old or difficult platforms.

If `trust_object_timestamps` is `TRUE` (default), then targets looks at the timestamp first. If it agrees with the timestamp recorded in the metadata, then targets considers the file unchanged. If the timestamps disagree, then targets
recomputes the hash to make a final determination. This practice reduces the number of hash computations and thus saves time. However, timestamp precision varies from a few nanoseconds at best to 2 entire seconds at worst, and timestamps with poor precision should not be fully trusted if there is any possibility that you will manually change the file within 2 seconds after the pipeline finishes. If the data store is on a file system with low-precision timestamps, then you may consider setting trust_object_timestamps to FALSE so targets errs on the safe side and always recomputes the hashes of files in _targets/objects/.

To check if your file system has low-precision timestamps, you can run file.create("x"); nanonext::msleep(1); file.create("y"); from within the directory containing the _targets data store and then check difftime(file.mtime("y"), file.mtime("x"), units = "secs"). If the value from difftime() is around 0.001 seconds (must be strictly above 0 and below 1) then you do not need to set trust_object_timestamps = FALSE.

Value

NULL (invisibly).

Storage formats

- "rds": Default, uses saveRDS() and readRDS(). Should work for most objects, but slow.
- "qs": Uses qs::qsave() and qs::qread(). Should work for most objects, much faster than "rds". Optionally set the preset for qsave() through tar_resources() and tar_resources_qs().
- "feather": Uses arrow::write_feather() and arrow::read_feather() (version 2.0). Much faster than "rds", but the value must be a data frame. Optionally set compression and compression_level in arrow::write_feather() through tar_resources() and tar_resources_feather(). Requires the arrow package (not installed by default).
- "parquet": Uses arrow::write_parquet() and arrow::read_parquet() (version 2.0). Much faster than "rds", but the value must be a data frame. Optionally set compression and compression_level in arrow::write_parquet() through tar_resources() and tar_resources_parquet(). Requires the arrow package (not installed by default).
- "fst": Uses fst::write_fst() and fst::read_fst(). Much faster than "rds", but the value must be a data frame. Optionally set the compression level for fst::write_fst() through tar_resources() and tar_resources_fst(). Requires the fst package (not installed by default).
- "fst tbl": Same as "fst", but the value is a data.table. Deep copies are made as appropriate in order to protect against the global effects of in-place modification. Optionally set the compression level the same way as for "fst".
- "fst tbl": Same as "fst", but the value is a tibble. Optionally set the compression level the same way as for "fst".
- "keras": superseded by tar_format() and incompatible with error = "null" (in tar_target() or tar_option_set()). Uses keras::save_model_hdf5() and keras::load_model_hdf5(). The value must be a Keras model. Requires the keras package (not installed by default).
- "torch": superseded by tar_format() and incompatible with error = "null" (in tar_target() or tar_option_set()). Uses torch::torch_save() and torch::torch_load(). The value
must be an object from the \texttt{torch} package such as a tensor or neural network module. Requires the \texttt{torch} package (not installed by default).

- "file": A dynamic file. To use this format, the target needs to manually identify or save some data and return a character vector of paths to the data (must be a single file path if \texttt{repository} is not "local"). (These paths must be existing files and nonempty directories.) Then, \texttt{targets} automatically checks those files and cues the appropriate run/skip decisions if those files are out of date. Those paths must point to files or directories, and they must not contain characters \texttt{|} or \texttt{*}. All the files and directories you return must actually exist, or else \texttt{targets} will throw an error. (And if storage is "worker", \texttt{targets} will first stall out trying to wait for the file to arrive over a network file system.) If the target does not create any files, the return value should be character(0).

If \texttt{repository} is not "local" and \texttt{format} is "file", then the character vector returned by the target must be of length 1 and point to a single file. (Directories and vectors of multiple file paths are not supported for dynamic files on the cloud.) That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

To check if the file is up to date, \texttt{targets} avoids timestamps and always recomputes the hash. If you find this to be too slow, and if you trust the time stamps on your file system (see the \texttt{trust\_object\_timestamps} argument of \texttt{tar\_option\_set()}), then consider \texttt{format = "file\_fast"} instead.

- "file\_fast": same as \texttt{format = "file"}, except that \texttt{targets} uses time stamps to check if a file is up to date. If the time stamp of the file agrees with the time stamp in the metadata, the file is considered up to date. Otherwise, \texttt{targets} recomputes the hash of the file to make a final determination. Low-precision timestamps are not reliable for this, and some file systems have timestamp precision as poor as 2 seconds. See the \texttt{trust\_object\_timestamps} argument of \texttt{tar\_option\_set()} for advice on this.

- "url": A dynamic input URL. For this storage format, \texttt{repository} is implicitly "local", URL format is like \texttt{format = "file"} except the return value of the target is a URL that already exists and serves as input data for downstream targets. Optionally supply a custom curl handle through \texttt{tar\_resources()} and \texttt{tar\_resources\_url()} in \texttt{new\_handle()}, \texttt{nobody = TRUE} is important because it ensures \texttt{targets} just downloads the metadata instead of the entire data file when it checks time stamps and hashes. The data file at the URL needs to have an ETag or a Last-Modified time stamp, or else the target will throw an error because it cannot track the data. Also, use extreme caution when trying to use \texttt{format = "url"} to track uploads. You must be absolutely certain the ETag and Last-Modified time stamp are fully updated and available by the time the target’s command finishes running. \texttt{targets} makes no attempt to wait for the web server.

- A custom format can be supplied with \texttt{tar\_format()}. For this choice, it is the user’s responsibility to provide methods for (un)serialization and (un)marshaling the return value of the target.

- The formats starting with "aws_" are deprecated as of 2022-03-13 (\texttt{targets} version > 0.10.0). For cloud storage integration, use the \texttt{repository} argument instead.

Other configuration: \texttt{tar\_config\_get()}, \texttt{tar\_config\_projects()}, \texttt{tar\_config\_set()}, \texttt{tar\_config\_unset()}, \texttt{tar\_config\_yaml()}, \texttt{tar\_envvars()}, \texttt{tar\_option\_get()}, \texttt{tar\_option\_reset()}
Examples

tar_option_get("format") # default format before we set anything
tar_target(x, 1)$settings$format
tar_option_set(format = "fst_tbl") # new default format
tar_option_get("format")
tar_target(x, 1)$settings$format
tar_option_reset() # reset the format
tar_target(x, 1)$settings$format
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      tar_option_set(cue = tar_cue(mode = "always")) # All targets always run.
      list(tar_target(x, 1), tar_target(y, 2))
    })
    tar_make()
    tar_make()
  })
}

Description

Checks for outdated targets in the pipeline, targets that will be rerun automatically if you call
`tar_make()` or similar. See `tar_cue()` for the rules that decide whether a target needs to rerun.

Usage

tar_outdated(
  names = NULL,
  shortcut = targets::tar_config_get("shortcut"),
  branches = FALSE,
  targets_only = TRUE,
  reporter = targets::tar_config_get("reporter_outdated"),
  secondsReporter = targets::tar_config_get("seconds_reporter"),
  seconds_interval = targets::tar_config_get("seconds_interval"),
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function, reporter),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)

Arguments

names Names of the targets. `tar_outdated()` will check these targets and all upstream
ancestors in the dependency graph. Set names to NULL to check/build all the targets (default). Otherwise, you can supply symbols or tidyselect helpers like
any_of() and starts_with(). Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not to individual dynamic branches.

shortcut
Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Also, shortcut = TRUE only works if you set names.

branches
Logical of length 1, whether to include branch names. Including branches could get cumbersome for large pipelines. Individual branch names are still omitted when branch-specific information is not reliable: for example, when a pattern branches over an outdated target.

targets_only
Logical of length 1, whether to just restrict to targets or to include functions and other global objects from the environment created by running the target script file (default: _targets.R).

reporter
Character of length 1, name of the reporter to user. Controls how messages are printed as targets are checked. Choices:
- "silent": print nothing.
- "forecast": print running totals of the checked and outdated targets found so far.

seconds_reporter
Positive numeric of length 1 with the minimum number of seconds between times when the reporter prints progress messages to the R console.

seconds_interval
Deprecated on 2023-08-24 (version 1.2.2.9001). Use seconds_meta_append, seconds_meta_upload, and seconds_reporter instead.

callr_function
A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments
A list of arguments to callr_function.

ev
An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The env argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.
script
Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

store
Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details
Requires that you define a pipeline with a target script file (default: `_targets.R`). (See `tar_script()` for details.)

Value
Names of the outdated targets.

Storage access
Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as `tar_render()` and `tar_quarto()`.

Examples
```r
evaluation
if (identical Sys.getenv("TAR_EXAMPLES", "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(list(tar_target(x, 1 + 1)))
tar_outdated()
tar_script({
    list(
        tar_target(y1, 1 + 1),
        tar_target(y2, 1 + 1),
    )
})
```
**Description**

Identify the file path to the target script of the pipeline currently running.

**Usage**

```r
 tar_path_script()
```

**Value**

Character, file path to the target script of the pipeline currently running. If called outside of the pipeline currently running, `tar_path_script()` returns `tar_config_get("script")`.

**See Also**

Other utilities: `tar_active()`, `tar_backoff()`, `tar_call()`, `tar_cancel()`, `tar_definition()`, `tar_envir()`, `tar_group()`, `tar_name()`, `tar_path()`, `tar_path_script_support()`, `tar_path_store()`, `tar_path_target()`, `tar_source()`, `tar_store()`

**Examples**

```r
 tar_path_script()
 if (identical(Sys.getenv("TAR_EXAMPLES"), "true")){ # for CRAN
  tar_dir(# tar_dir() runs code from a temp dir for CRAN.
  script <- tempfile()
  tar_script(tar_target(x, tar_path_script()), script = script, ask = FALSE)
  tar_make(script = script)
  tar_read(x)
 }}
```
Description

Identify the directory path to the support scripts of the current target script of the pipeline currently running.

Usage

tar_path_script_support()

Details

A target script (default: _targets.R) comes with support scripts if it is written by Target Mark-down. These support scripts usually live in a folder called _targets_r/, but the path may vary from case to case. The tar_path_script_support() returns the path to the folder with the support scripts.

Value

Character, directory path to the target script of the pipeline currently running. If called outside of the pipeline currently running, tar_path_script() returns tar_config_get("script").

See Also

Other utilities: tar_active(), tar_backoff(), tar_call(), tar_cancel(), tar_definition(), tar_envir(), tar_group(), tar_name(), tar_path(), tar_path_script(), tar_path_store(), tar_path_target(), tar_source(), tar_store()

Examples

tar_path_script_support()
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
script <- tempfile()
tar_script{
  tar_target(x, tar_path_script_support()),
  script = script,
  ask = FALSE
}
tar_make(script = script)
tar_read(x)
})
}
**tar_path_store**

Current data store path

---

**Description**

Identify the file path to the data store of the pipeline currently running.

**Usage**

```r
  tar_path_store()
```

**Value**

Character, file path to the data store of the pipeline currently running. If called outside of the pipeline currently running, `tar_path_store()` returns `tar_config_get("store")`.

**See Also**

Other utilities: `tar_active()`, `tar_backoff()`, `tar_call()`, `tar_cancel()`, `tar_definition()`, `tar_envir()`, `tar_group()`, `tar_name()`, `tar_path()`, `tar_path_script()`, `tar_path_script_support()`, `tar_path_target()`, `tar_source()`, `tar_store()`

**Examples**

```r
  tar_path_store()
  if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {  # for CRAN
    tar_dir({  # tar_dir() runs code from a temp dir for CRAN.
      tar_script(tar_target(x, tar_path_store()), ask = FALSE)
    }
    store <- tempfile()
    tar_make(store = store)
    tar_read(x, store = store)
  }
```

---

**tar_path_target**

Identify the file path where a target will be stored.

---

**Description**

Identify the file path where a target will be stored after the target finishes running in the pipeline.

**Usage**

```r
  tar_path_target(
    name = NULL,
    default = NA_character_,
    create_dir = FALSE,
    store = targets::tar_config_get("store")
  )
```
Arguments

name Symbol, name of a target. If NULL, `tar_path_target()` returns the path of the target currently running in a pipeline.

default Character, value to return if `tar_path_target()` is called on its own outside a `targets` pipeline. Having a default lets users run things without `tar_make()`, which helps peel back layers of code and troubleshoot bugs.

create_dir Logical of length 1, whether to create `dirname(tar_path_target())` in `tar_path_target()` itself. This is useful if you are writing to `tar_path_target()` from inside a `storage = "none"` target and need the parent directory of the file to exist.

store Character of length 1, path to the data store if `tar_path_target()` is called outside a running pipeline. If `tar_path_target()` is called inside a running pipeline, this argument is ignored and actual the path to the running pipeline’s data store is used instead.

Value

Character, file path of the return value of the target. If not called from inside a running target, `tar_path_target(name = your_target)` just returns `_targets/objects/your_target`, the file path where `your_target` will be saved unless `format` is equal to ”file” or any of the supported cloud-based storage formats.

For non-cloud storage formats, if you call `tar_path_target()` with no arguments while target `x` is running, the name argument defaults to the name of the running target, so `tar_path_target()` returns `_targets/objects/x`.

For cloud-backed formats, `tar_path_target()` returns the path to the staging file in `_targets/scratch/`. That way, even if you select a cloud repository (e.g. `tar_target(..., repository = "aws", storage = "none")`) then you can still manually write to `tar_path_target(create_dir = TRUE)` and the `targets` package will automatically hash it and upload it to the AWS S3 bucket. This does not apply to `format = "file"`, where you would never need `storage = "none"` anyway.

See Also

Other utilities: `tar_active()`, `tar_backoff()`, `tar_call()`, `tar_cancel()`, `tar_definition()`, `tar_envir()`, `tar_group()`, `tar_name()`, `tar_path()`, `tar_path_script()`, `tar_path_script_support()`, `tar_path_store()`, `tar_source()`, `tar_store()`

Examples

tar_path_target()
tar_path_target(your_target)
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(tar_target(returns_path, tar_path_target()), ask = FALSE)
tar_make()
tar_read(returns_path)
})
}
**tar_pattern**

*Emulate dynamic branching.*

**Description**

Emulate the dynamic branching process outside a pipeline. `tar_pattern()` can help you understand the overall branching structure that comes from the `pattern` argument of `tar_target()`.

**Usage**

```r
tar_pattern(pattern, ..., seed = 0L)
```

**Arguments**

- `pattern` Function call with the pattern specification.
- `...` Named integers, each of length 1. Each name is the name of a dependency target, and each integer is the length of the target (number of branches or slices). Names must be unique.
- `seed` Integer of length 1, random number generator seed to emulate the pattern reproducibly. (The `sample()` pattern is random). In a real pipeline, the seed is automatically generated from the target name in deterministic fashion.

**Details**

Dynamic branching is a way to programmatically create multiple new targets based on the values of other targets, all while the pipeline is running. Use the `pattern` argument of `tar_target()` to get started. `pattern` accepts a function call composed of target names and any of the following patterns:

- `map()`: iterate over one or more targets in sequence.
- `cross()`: iterate over combinations of slices of targets.
- `slice()`: select one or more slices by index, e.g. `slice(x, index = c(3, 4))` selects the third and fourth slice or branch of `x`.
- `head()`: restrict branching to the first few elements.
- `tail()`: restrict branching to the last few elements.
- `sample()`: restrict branching to a random subset of elements.

**Value**

A tibble showing the kinds of dynamic branches that `tar_target()` would create in a real pipeline with the given pattern. Each row is a dynamic branch, each column is a dependency target, and each element is the name of an upstream bud or branch that the downstream branch depends on. Buds are pieces of non-branching targets (“stems”) and branches are pieces of patterns. The returned bud and branch names are not the actual ones you will see when you run the pipeline, but they do communicate the branching structure of the pattern.
See Also

Other branching: `tar_branch_index()`, `tar_branch_names()`, `tar_branch_names_raw()`, `tar_branches()`

Examples

```r
# To use dynamic map for real in a pipeline,
# call map() in a target's pattern.
# The following code goes at the bottom of
# your target script file (default: `\_targets.R`).
list(
  tar_target(x, seq_len(2)),
  tar_target(y, head(letters, 2)),
  tar_target(dynamic, c(x, y), pattern = map(x, y)) # 2 branches
)
# Likewise for more complicated patterns.
list(
  tar_target(x, seq_len(2)),
  tar_target(y, head(letters, 2)),
  tar_target(z, head(LETTERS, 2)),
  tar_target(dynamic, c(x, y, z), pattern = cross(z, map(x, y))) #4 branches
)
# But you can emulate dynamic branching without running a pipeline
# in order to understand the patterns you are creating. Simply supply
# the pattern and the length of each dependency target.
# The returned data frame represents the branching structure of the pattern:
# One row per new branch, one column per dependency target, and
# one element per bud/branch in each dependency target.

tar_pattern(
  cross(x, map(y, z)),
  x = 2,
  y = 3,
  z = 3
)

tar_pattern(
  head(cross(x, map(y, z)), n = 2),
  x = 2,
  y = 3,
  z = 3
)
```

---

**tar_pid**

*Get main process ID.*

**Description**

Get the process ID (PID) of the most recent main R process to orchestrate the targets of the current project.
**Usage**

```
tar_pid(store = targets::tar_config_get("store"))
```

**Arguments**

- **store**

  Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Details**

The main process is the R process invoked by `tar_make()` or similar. If `callr_function` is not `NULL`, this is an external process, and the pid in the return value will not agree with `Sys.getpid()` in your current interactive session. The process may or may not be alive. You may want to check it with `ps::ps_is_running(ps::ps_handle(targets::tar_pid()))` before running another call to `tar_make()` for the same project.

**Value**

Integer with the process ID (PID) of the most recent main R process to orchestrate the targets of the current project.

**See Also**

Other data: `tar_crew()`, `tar_load()`, `tar_load_everything()`, `tar_load_raw()`, `tar_objects()`, `tar_process()`, `tar_read()`, `tar_read_raw()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {  # for CRAN
tar_dir({  # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(x, seq_len(2)),
    tar_target(y, 2 * x, pattern = map(x))
  )
}, ask = FALSE)
tar_make()
Sys.getpid()
tar_pid()  # Different from the current PID.
})
}```
tar_poll

Repeatedly poll progress in the R console.

Description

Print the information in \texttt{tar_progress_summary()} at regular intervals.

Usage

\begin{verbatim}
tar_poll(
    interval = 1,
    timeout = Inf,
    fields = c("skipped", "dispatched", "completed", "errored", "canceled", "since"),
    store = targets::tar_config_get("store")
)
\end{verbatim}

Arguments

\begin{itemize}
\item \texttt{interval} Number of seconds to wait between iterations of polling progress.
\item \texttt{timeout} How many seconds to run before exiting.
\item \texttt{fields} Optional, names of progress data columns to read. Set to \texttt{NULL} to read all fields.
\item \texttt{store} Character of length 1, path to the \texttt{targets} data store. Defaults to \texttt{tar_config_get("store")}, which in turn defaults to \texttt{_targets/}. When you set this argument, the value of \texttt{tar_config_get("store")} is temporarily changed for the current function call. See \texttt{tar_config_get()} and \texttt{tar_config_set()} for details about how to set the data store path persistently for a project.
\end{itemize}

Value

\texttt{NULL} (invisibly). Called for its side effects.

See Also

Other progress: \texttt{tar_canceled()}, \texttt{tar_completed()}, \texttt{tar_dispatched()}, \texttt{tar_errored()}, \texttt{tar_progress()}, \texttt{tar_progress_branches()}, \texttt{tar_progress_summary()}, \texttt{tar_skipped()}, \texttt{tar_watch()}, \texttt{tar_watch_server()}, \texttt{tar_watch_ui()}

Examples

\begin{verbatim}
if (identical(Sys.getenv("TAR_INTERACTIVE_EXAMPLES"), "true")) {
    tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
        tar_script({
            list(
                tar_target(x, seq_len(100)),
                tar_target(y, Sys.sleep(0.1), pattern = map(x))
            )
        }, ask = FALSE)
    }
\end{verbatim}
Get main process info.

Description

Get info on the most recent main R process to orchestrate the targets of the current project.

Usage

tar_process(names = NULL, store = targets::tar_config_get("store"))

Arguments

- **names**: Optional, names of the data points to return. If supplied, tar_process() returns only the rows of the names you select. You can supply symbols or tidyselect helpers like any_of() and starts_with(). If NULL, all names are selected.
- **store**: Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

The main process is the R process invoked by tar_make() or similar. If callr_function is not NULL, this is an external process, and the pid in the return value will not agree with Sys.getpid() in your current interactive session. The process may or may not be alive. You may want to check the status with tar_pid() %in% ps::ps_pids() before running another call to tar_make() for the same project.

Value

A data frame with metadata on the most recent main R process to orchestrate the targets of the current project. The output includes the pid of the main process.

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(x, seq_len(2)),
    tar_target(y, 2 * x, pattern = map(x))
  ), ask = FALSE)
tar_make()
tar_process()
tar_process(pid)
})
}
```

---

**tar_progress**

*Read progress.*

### Description

Read a project’s target progress data for the most recent run of `tar_make()` or similar. Only the most recent record is shown.

### Usage

```r
tar_progress(
  names = NULL,
  fields = "progress",
  store = targets::tar_config_get("store")
)
```
Arguments

names  Optional, names of the targets. If supplied, `tar_progress()` only returns progress information on these targets. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`.

fields Optional, names of progress data columns to read. Set to `NULL` to read all fields.

store Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

A data frame with one row per target and the following columns:

- name: name of the target.
- type: type of target: "stem" for non-branching targets, "pattern" for dynamically branching targets, and "branch" for dynamic branches.
- parent: name of the target's parent. For branches, this is the name of the associated pattern. For other targets, the pattern is just itself.
- branches: number of dynamic branches of a pattern. 0 for non-patterns.
- progress: the most recent progress update of that target. Could be "dispatched", "completed", "skipped", "canceled", or "errored". "dispatched" means the target was sent off to be run, but in the case of `tar_make()` with a crew controller, the target might not actually start running right away if the crew workers are all busy.

Storage access

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. Other progress: `tar_canceled()`, `tar_completed()`, `tar_dispatched()`, `tar_errored()`, `tar_poll()`, `tar_progress_branches()`, `tar_progress_summary()`, `tar_skipped()`, `tar_watch()`, `tar_watch_server()`, `tar_watch_ui()`
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {  # for CRAN
  tar_dir({  # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
      ), ask = FALSE
    }
  )
  tar_make()
  tar_progress()
  tar_progress(starts_with("y_"))  # see also any_of()
}
```

---

tar_progress_branches  Tabulate the progress of dynamic branches.

Description

Read a project’s target progress data for the most recent run of the pipeline and display the tabulated status of dynamic branches. Only the most recent record is shown.

Usage

```r
tar_progress_branches(
  names = NULL,
  fields = NULL,
  store = targets::tar_config_get("store")
)
```

Arguments

- **names**  Optional, names of the targets. If supplied, `tar_progress()` only returns progress information on these targets. You can supply symbols or tidyselect helpers like `starts_with()`.
- **fields**  Optional, names of progress data columns to read. Set to `NULL` to read all fields.
- **store**  Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.
**Value**

A data frame with one row per target per progress status and the following columns.

- **name**: name of the pattern.
- **progress**: progress status: "dispatched", "completed", "cancelled", or "errored".
- **branches**: number of branches in the progress category.
- **total**: total number of branches planned for the whole pattern. Values within the same pattern should all be equal.

**See Also**

Other progress: `tar_canceled()`, `tar_completed()`, `tar_dispatched()`, `tar_errored()`, `tar_poll()`, `tar_progress()`, `tar_progress_summary()`, `tar_skipped()`, `tar_watch()`, `tar_watch_server()`, `tar_watch_ui()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(
  list(
    tar_target(x, seq_len(2)),
    tar_target(y, x, pattern = map(x)),
    tar_target(z, stopifnot(y < 1.5), pattern = map(y))
  ), ask = FALSE)
try(tar_make())
tar_progress_branches()
})
}
```

---

**tar_progress_summary**  
Summarize target progress.

---

**Description**

Summarize the progress of a run of the pipeline.

**Usage**

```r
tar_progress_summary(
  fields = c("skipped", "dispatched", "completed", "errored", "canceled", "since"),
  store = targets::tar_config_get("store")
)
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fields</td>
<td>Optional, names of progress data columns to read. Set to NULL to read all fields.</td>
</tr>
<tr>
<td>store</td>
<td>Character of length 1, path to the targets data store. Defaults to <code>tar_config_get(&quot;store&quot;)</code>, which in turn defaults to <code>_targets/</code>. When you set this argument, the value of <code>tar_config_get(&quot;store&quot;)</code> is temporarily changed for the current function call. See <code>tar_config_get()</code> and <code>tar_config_set()</code> for details about how to set the data store path persistently for a project.</td>
</tr>
</tbody>
</table>

Value

A data frame with one row and the following optional columns that can be selected with `fields`.

- **dispatched**: number of targets that were sent off to run and did not (yet) finish. These targets may not actually be running, depending on the status and workload of parallel workers.
- **completed**: number of targets that completed without error or cancellation.
- **errored**: number of targets that threw an error.
- **canceled**: number of canceled targets (see `tar_cancel()`).
- **since**: how long ago progress last changed (`Sys.time() - time`).
- **time**: the time when the progress last changed (modification timestamp of the `_targets/meta/progress` file).

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(x, seq_len(2)),
    tar_target(y, x, pattern = map(x)),
    tar_target(z, stopifnot(y < 1.5), pattern = map(y), error = "continue")
  ),
}, ask = FALSE)
try(tar_make())
tar_progress_summary()
})
}
```
\texttt{tar_prune} \quad \textit{Remove targets that are no longer part of the pipeline.}

\textbf{Description}

Remove target values from \texttt{_targets/objects/} and the cloud and remove target metadata from \texttt{_targets/meta/meta} for targets that are no longer part of the pipeline.

\textbf{Usage}

\begin{verbatim}
tar_prune(
  cloud = TRUE,
  batch_size = 1000L,
  verbose = TRUE,
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)
\end{verbatim}

\textbf{Arguments}

- \texttt{cloud} \quad Logical of length 1, whether to delete objects from the cloud if applicable (e.g. AWS, GCP). If \texttt{FALSE}, files are not deleted from the cloud.

- \texttt{batch_size} \quad Positive integer between 1 and 1000, number of target objects to delete from the cloud with each HTTP API request. Currently only supported for AWS. Cannot be more than 1000.

- \texttt{verbose} \quad Logical of length 1, whether to print console messages to show progress when deleting each batch of targets from each cloud bucket. Batched deletion with verbosity is currently only supported for AWS.

- \texttt{callr_function} \quad A function from \texttt{callr} to start a fresh clean \texttt{R} process to do the work. Set to \texttt{NULL} to run in the current session instead of an external process (but restart your \texttt{R} session just before you do in order to clear debris out of the global environment). \texttt{callr_function} needs to be \texttt{NULL} for interactive debugging, e.g. \texttt{tar_option_set(debug = "your_target")}. However, \texttt{callr_function} should not be \texttt{NULL} for serious reproducible work.

- \texttt{callr_arguments} \quad A list of arguments to \texttt{callr_function}.

- \texttt{envir} \quad An environment, where to run the target \texttt{R} script (default: \texttt{_targets.R}) if \texttt{callr_function} is \texttt{NULL}. Ignored if \texttt{callr_function} is anything other than \texttt{NULL}. \texttt{callr_function} should only be \texttt{NULL} for debugging and testing purposes, not for serious runs of a pipeline, etc.

The \texttt{envir} argument of \texttt{tar_make()} and related functions always overrides the current value of \texttt{tar_option_get("envir")} in the current \texttt{R} session just before
running the target script file, so whenever you need to set an alternative envir, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then envir2 will be used.

**script**

Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

**store**

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

### Details

tar_prune() is useful if you recently worked through multiple changes to your project and are now trying to discard irrelevant data while keeping the results that still matter. Global objects and local files with format = "file" outside the data store are unaffected. Also removes `_targets/scratch/`, which is only needed while `tar_make()`, `tar_make_clustermq()`, or `tar_make_future()` is running. To list the targets that will be pruned without actually removing anything, use `tar_prune_list()`.

### Value

NULL except if `callr_function` is `callr::r_bg`, in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

### Storage access

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as `tar_render()` and `tar_quarto()`.

The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as `tar_render()` and `tar_quarto()`.

### Cloud target data versioning

Some buckets in Amazon S3 or Google Cloud Storage are "versioned", which means they track historical versions of each data object. If you use targets with cloud storage [https://books.](https://books.}

ropensci.org/targets/cloud-storage.html) and versioning is turned on, then targets will record each version of each target in its metadata.

Functions like `tar_read()` and `tar_load()` load the version recorded in the local metadata, which may not be the same as the "current" version of the object in the bucket. Likewise, functions `tar_delete()` and `tar_destroy()` only remove the version ID of each target as recorded in the local metadata.

If you want to interact with the latest version of an object instead of the version ID recorded in the local metadata, then you will need to delete the object from the metadata.

1. Make sure your local copy of the metadata is current and up to date. You may need to run `tar_meta_download()` or `tar_meta_sync()` first.
2. Run `tar_unversion()` to remove the recorded version IDs of your targets in the local metadata.
3. With the version IDs gone from the local metadata, functions like `tar_read()` and `tar_destroy()` will use the latest version of each target data object.
4. Optional: to back up the local metadata file with the version IDs deleted, use `tar_meta_upload()`.

`tar_prune_inspect`

Other clean: `tar_delete()`, `tar_destroy()`, `tar_invalidate()`, `tar_prune_list()`, `tar_unversion()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(y1, 1 + 1),
    tar_target(y2, 1 + 1),
    tar_target(z, y1 + y2)
  )
}, ask = FALSE)
tar_make()
# Remove some targets from the pipeline.
tar_script(list(tar_target(y1, 1 + 1)), ask = FALSE)
# Keep only the remaining targets in the data store.
tar_prune()
})
}
```

---

**tar_prune_list**

List targets that `tar_prune()` will remove.

**Description**

List the targets that `tar_prune()` will remove. Does not actually remove any targets.
Usage

tar_prune_list(
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function),
  envir = parent.frame(),
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)

Arguments

callr_function A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

callr_arguments A list of arguments to callr_function.

envir An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

See tar_prune() for details.
Value

If `callr_function` is `callr::r_bg`, the return value is a handle to the `callr` background process is returned. Otherwise, the return value is a character vector of target names identifying targets that `tar_prune()` will remove.

See Also

tar_prune

Other clean: `tar_delete()`, `tar_destroy()`, `tar_invalidate()`, `tar_prune()`, `tar_unversion()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(  
    tar_target(y1, 1 + 1),
    tar_target(y2, 1 + 1),
    tar_target(z, y1 + y2)
  )
}, ask = FALSE)
tar_make()  # Remove some targets from the pipeline.
tar_script(list(tar_target(y1, 1 + 1)), ask = FALSE)  # List targets that tar_prune() will remove.
tar_prune_list()  
})
}
```

---

tar_read  

Read a target’s value from storage.

Description

Read a target’s return value from its file in `_targets/objects/`. For dynamic files (i.e. `format = "file"`) the paths are returned.

Usage

```r
tar_read(
  name,
  branches = NULL,
  meta = tar_meta(store = store),
  store = targets::tar_config_get("store")
)
```
Arguments

- **name**: Symbol, name of the target to read.
- **branches**: Integer of indices of the branches to load if the target is a pattern.
- **meta**: Data frame of metadata from `tar_meta()`. `tar_read()` with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call `tar_meta()` beforehand and supply it to the `meta` argument, then successive calls to `tar_read()` may run much faster.
- **store**: Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

The target’s return value from its file in `_targets/objects/`, or the paths to the custom files and directories if `format = "file"` was set.

**See Also**

Other data: `tar_crew()`, `tar_load()`, `tar_load_everything()`, `tar_load_raw()`, `tar_objects()`, `tar_pid()`, `tar_process()`, `tar_read_raw()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {  # for CRAN
  tar_dir({  # tar_dir() runs code from a temp dir for CRAN.
    tar_script(list(tar_target(x, 1 + 1)), ask = FALSE)
    tar_make()
    tar_read(x)
  })
}
```

**Description**

Like `tar_read()` except name is a character string. Do not use in knitr or R Markdown reports with `tarchetypes::tar_knit()` or `tarchetypes::tar_render()`.

**Usage**

```r
tar_read_raw(
  name,
  branches = NULL,
  meta = tar_meta(store = store),
  store = targets::tar_config_get("store")
)
```

**Arguments**

- **name** Character, name of the target to read.
- **branches** Integer of indices of the branches to load if the target is a pattern.
- **meta** Data frame of metadata from `tar_meta()`. `tar_read()` with the default arguments can be inefficient for large pipelines because all the metadata is stored in a single file. However, if you call `tar_meta()` beforehand and supply it to the `meta` argument, then successive calls to `tar_read()` may run much faster.
store  Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Value

The target's return value from its file in `_targets/objects/`, or the paths to the custom files and directories if `format = "file"` was set.

Storage access

    tar_make()
    tar_read_raw("x")
  })
}
```

---

**tar_renv**

*Set up package dependencies for compatibility with renv*

**Description**

Write package dependencies to a script file (by default, named `_targets_packages.R` in the root project directory). Each package is written to a separate line as a standard `library()` call (e.g. `library(package)`) so renv can identify them automatically.

**Usage**

```
tar_renv(
  extras = c("bs4Dash", "clustermq", "future", "gt", "markdown", "pingr", "rstudioapi", "shiny", "shinybusy", "shinyWidgets", "visNetwork"),
  path = "_targets_packages.R",
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function),
  envir = parent.frame(),
  script = targets::tar_config_get("script")
)
```

**Arguments**

- `extras` Character vector of additional packages to declare as project dependencies.
- `path` Character of length 1, path to the script file to populate with `library()` calls.
- `callr_function` A function from callr to start a fresh clean R process to do the work. Set to `NULL` to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be `NULL` for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be `NULL` for serious reproducible work.
- `callr_arguments` A list of arguments to `callr_function`. 
envir

An environment, where to run the target R script (default: `_targets.R`) if `callr_function` is `NULL`. Ignored if `callr_function` is anything other than `NULL`. `callr_function` should only be `NULL` for debugging and testing purposes, not for serious runs of a pipeline, etc.

The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir`, you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then `envir2` will be used.

script

Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

Details

This function gets called for its side-effect, which writes package dependencies to a script for compatibility with `renv`. The generated file should not be edited by hand and will be overwritten each time `tar_renv()` is called.

The behavior of `renv` is to create and manage a project-local R library and keep a record of project dependencies in a file called `renv.lock`. To identify dependencies, `renv` crawls through code to find packages explicitly mentioned using `library()`, `require()`, or `::`. However, `targets` manages packages in a way that hides dependencies from `renv`. `tar_renv()` finds package dependencies that would be otherwise hidden to `renv` because they are declared using the `targets` API. Thus, calling `tar_renv` this is only necessary if using `tar_option_set()` or `tar_target()` to use specialized storage formats or manage packages.

With the script written by `tar_renv()`, `renv` is able to crawl the file to identify package dependencies (with `renv::dependencies()`). `tar_renv()` only serves to make your `targets` project compatible with `renv`, it is still the users responsibility to call `renv::init()` and `renv::snapshot()` directly to initialize and manage a project-local R library. This allows your `targets` pipeline to have its own self-contained R library separate from your standard R library. See [https://rstudio.github.io/renv/index.html](https://rstudio.github.io/renv/index.html) for more information.

Value

Nothing, invisibly.

Performance

If you use `renv`, then overhead from project initialization could slow down `tar_make()` and friends. If you experience slowness, please make sure your `renv` library is on a fast file system. (For example, slow network drives can severely reduce performance.) In addition, you can disable the slowest `renv` initialization checks. After confirming at [https://rstudio.github.io/renv/reference/config.html](https://rstudio.github.io/renv/reference/config.html) that you can safely disable these checks, you can write lines `RENV_CONFIG_RSPM_ENABLED=false`, `RENV_CONFIG_SANDBOX_ENABLED=false`, and `RENV_CONFIG_SYNCHRONIZED_CHECK=false` in your
user-level `.Renviron` file. If you disable the synchronization check, remember to call `renv::status()` periodically to check the health of your renv project library.

Other scripts: `tar_edit()`, `tar_github_actions()`, `tar_helper()`, `tar_helper_raw()`, `tar_script()`

**Examples**

```r
# tar_dir() runs code from a temp dir for CRAN.
# tar_script() runs code from a temp dir for CRAN.
# tar_make() runs code from a temp dir for CRAN.

# Create a reproducible example of the problem
# tar_reprex:
# https://github.com/ropensci/targets/discussions

tar_reprex(pipeline = tar_target(example_target, 1)
run = tar_make(), ...)
```

**Description**

Create a reproducible example of a targets pipeline with the reprex package.

**Usage**

```r
tar_reprex(pipeline = tar_target(example_target, 1), run = tar_make(), ...)
```

**Arguments**

- `pipeline` R code for the target script file `_targets.R`. library(targets) is automatically written at the top.
- `run` R code to inspect and run the pipeline.
- `...` Named arguments passed to reprex::reprex().

**Details**

The best way to get help with an issue is to create a reproducible example of the problem and post it to [https://github.com/ropensci/targets/discussions](https://github.com/ropensci/targets/discussions) tar_reprex() facilitates this process. It is like reprex::reprex((targets::tar_script(...); tar_make())), but more convenient.

**Value**

A character vector of rendered the reprex, invisibly.
See Also

Examples

```r
if (identical(Sys.getenv("TAR_INTERACTIVE_EXAMPLES"), "true")) {
  tar_reprex(
    pipeline = {
      list(
        tar_target(data, data.frame(x = sample.int(1e3))),
        tar_target(summary, mean(data$x, na.rm = TRUE))
      ),
    },
    run = {
      tar_visnetwork()
      tar_make()
    }
  )
}
```

---

## tar_resources

**Target resources**

### Description

Create a resources argument for `tar_target()` or `tar_option_set()`.

### Usage

```r
tar_resources(
  aws = tar_option_get("resources")$aws,
  clustermq = tar_option_get("resources")$clustermq,
  crew = tar_option_get("resources")$crew,
  feather = tar_option_get("resources")$feather,
  fst = tar_option_get("resources")$fst,
  future = tar_option_get("resources")$future,
  gcp = tar_option_get("resources")$gcp,
  network = tar_option_get("resources")$network,
  parquet = tar_option_get("resources")$parquet,
  qs = tar_option_get("resources")$qs,
  url = tar_option_get("resources")$url
)
```

### Arguments

- `aws` Output of function `tar_resources_aws()`. Amazon Web Services (AWS) S3 storage settings for `tar_target(..., repository = "aws")`. See the cloud storage section of [https://books.ropensci.org/targets/data.html](https://books.ropensci.org/targets/data.html) for details for instructions.
**tar_resources**

**clustermq**
Output of function `tar_resources_clustermq()`. Optional clustermq settings for `tar_make_clustermq()`, including the `log_worker` and `template` arguments of `clustermq::workers()`. Clustermq workers are *persistent*, so there is not a one-to-one correspondence between workers and targets. The clustermq resources apply to the workers, not the targets. So the correct way to assign clustermq resources is through `tar_option_set()`, not `tar_target()`. Clustermq resources in individual `tar_target()` calls will be ignored.

**crew**
Output of function `tar_resources_crew()` with target-specific settings for integration with the crew R package. These settings are arguments to the `push()` method of the controller or controller group object which control things like auto-scaling behavior and the controller to use in the case of a controller group.

**feather**
Output of function `tar_resources_feather()`. Non-default arguments to `arrow::read_feather()` and `arrow::write_feather()` for arrow/feather-based storage formats. Applies to all formats ending with the ".feather" suffix. For details on formats, see the `format` argument of `tar_target()`.

**fst**
Output of function `tar_resources_fst()`. Non-default arguments to `fst::read_fst()` and `fst::write_fst()` for fst-based storage formats. Applies to all formats ending with "fst" in the name. For details on formats, see the `format` argument of `tar_target()`.

**future**
Output of function `tar_resources_future()`. Optional future settings for `tar_make_future()`, including the `resources` argument of `future::future()`, which can include values to insert in template placeholders in future.batchtools template files. This is how to supply the `resources` argument of `future::future()` for targets. Resources supplied through `future::plan()` and `future::tweak()` are completely ignored.

**gcp**
Output of function `tar_resources_gcp()`. Google Cloud Storage bucket settings for `tar_target(..., repository = "gcp")`. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

**network**
Output of function `tar_resources_network()`. Settings to configure how to handle unreliable network connections in the case of uploading, downloading, and checking data in situations that rely on network file systems or HTTP/HTTPS requests. Examples include retries and timeouts for internal storage management operations for storage = "worker" or format = "file" (on network file systems), format = "url", repository = "aws", and repository = "gcp". These settings do not apply to actions you take in the custom R command of the target.

**parquet**
Output of function `tar_resources_parquet()`. Non-default arguments to `arrow::read_parquet()` and `arrow::write_parquet()` for arrow/parquet-based storage formats. Applies to all formats ending with the ".parquet" suffix. For details on formats, see the `format` argument of `tar_target()`.

**qs**
Output of function `tar_resources_qs()`. Non-default arguments to `qs::qread()` and `qs::qsave()` for qs-based storage formats. Applies to all formats ending with the ".qs" suffix. For details on formats, see the `format` argument of `tar_target()`.

**url**
Output of function `tar_resources_url()`. Non-default settings for storage formats ending with the ".url" suffix. These settings include the curl handle for...
extra control over HTTP requests. For details on formats, see the `format` argument of `tar_target()`.

**Value**

A list of objects of class "tar_resources" with non-default settings of various optional backends for data storage and high-performance computing.

**Resources**

Functions `tar_target()` and `tar_option_set()` each takes an optional `resources` argument to supply non-default settings of various optional backends for data storage and high-performance computing. The `tar_resources()` function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from `tar_option_get("resources")`. For example, suppose you set `tar_option_set(resources = tar_resources(aws = my_aws))`, where `my_aws` equals `tar_resources_aws(bucket = "x", prefix = "y")`. Then, `tar_target(data, get_data())` will have bucket "x" and prefix "y". In addition, if `new_resources` equals `tar_resources(aws = tar_resources_aws(bucket = "z"))`, then `tar_target(data, get_data(), resources = new_resources)` will use the new bucket "z", but it will still use the prefix "y" supplied through `tar_option_set()`. (In targets 0.12.1 and below, options like prefix do not carry over from `tar_option_set()` if you supply non-default resources to `tar_target()`.)

**See Also**

Other resources: `tar_resources_aws()`, `tar_resources_clustermq()`, `tar_resources_crew()`, `tar_resources_feather()`, `tar_resources_fst()`, `tar_resources_future()`, `tar_resources_gcp()`, `tar_resources_network()`, `tar_resources_parquet()`, `tar_resources_qs()`, `tar_resources_url()`

**Examples**

```r
# Somewhere in your target script file (usually _targets.R):
tar_target(
  name,
  command(),
  format = "qs",
  resources = tar_resources(
    qs = tar_resources_qs(preset = "fast"),
    future = tar_resources_future(resources = list(n_cores = 1))
  )
)
```
**tar_resources_aws**  

**Target resources: Amazon Web Services (AWS) S3 storage**

**Description**

Create the `aws` argument of `tar_resources()` to specify optional settings to AWS for `tar_target(..., repository = "aws")`. See the `format` argument of `tar_target()` for details.

**Usage**

```r
tar_resources_aws(
  bucket = targets::tar_option_get("resources")$aws$bucket,
  prefix = targets::tar_option_get("resources")$aws$prefix,
  region = targets::tar_option_get("resources")$aws$region,
  endpoint = targets::tar_option_get("resources")$aws$endpoint,
  s3_force_path_style = targets::tar_option_get("resources")$aws$s3_force_path_style,
  part_size = targets::tar_option_get("resources")$aws$part_size,
  page_size = targets::tar_option_get("resources")$aws$page_size,
  max_tries = targets::tar_option_get("resources")$aws$max_tries,
  seconds_timeout = targets::tar_option_get("resources")$aws$seconds_timeout,
  close_connection = targets::tar_option_get("resources")$aws$close_connection,
  verbose = targets::tar_option_get("resources")$aws$verbose,
  ...
)
```

**Arguments**

- **bucket**: Character of length 1, name of an existing bucket to upload and download the return values of the affected targets during the pipeline.
- **prefix**: Character of length 1, "directory path" in the bucket where your target object and metadata will go. Please supply an explicit prefix unique to your targets project. In the future, targets will begin requiring explicitly user-supplied prefixes. (This last note was added on 2023-08-24: targets version 1.2.2.9000.)
- **region**: Character of length 1, AWS region containing the S3 bucket. Set to `NULL` to use the default region.
- **endpoint**: Character of length 1, URL endpoint for S3 storage. Defaults to the Amazon AWS endpoint if `NULL`. Example: To use the S3 protocol with Google Cloud Storage, set `endpoint = "https://storage.googleapis.com"` and `region = "auto"`. (A custom endpoint may require that you explicitly set a custom region directly in `tar_resources_aws()`. `region = "auto"` happens to work with Google Cloud.) Also make sure to create HMAC access keys in the Google Cloud Storage console (under Settings => Interoperability) and set the `AWS_ACCESS_KEY_ID` and `AWS_SECRET_ACCESS_KEY` environment variables accordingly. After that, you should be able to use S3 storage formats with Google Cloud storage buckets. There is one limitation, however: even if your bucket has object versioning turned on, targets may fail to record object versions. Google Cloud Storage in particular has this incompatibility.
s3_force_path_style
Logical of length 1, whether to use path-style addressing for S3 requests.

part_size
Positive numeric of length 1, number of bytes for each part of a multipart upload. (Except the last part, which is the remainder.) In a multipart upload, each part must be at least 5 MB. The default value of the part_size argument is $5 \times (2^{20})$.

page_size
Positive integer of length 1, number of items in each page for paginated HTTP requests such as listing objects.

max_tries
Positive integer of length 1, maximum number of attempts to access a network resource on AWS.

seconds_timeout
Positive numeric of length 1, number of seconds until an HTTP connection times out.

close_connection
Logical of length 1, whether to close HTTP connections immediately.

verbose
Logical of length 1, whether to print console messages when running computationally expensive operations such as listing objects in a large bucket.

... Named arguments to functions in paws.storage::s3() to manage S3 storage. The documentation of these specific functions is linked from https://www.paws-r-sdk.com/docs/s3/. The configurable functions themselves are:

- paws.storage::s3()$head_object()
- paws.storage::s3()$get_object()
- paws.storage::s3()$delete_object()
- paws.storage::s3()$put_object()
- paws.storage::s3()$create_multipart_upload()
- paws.storage::s3()$abort_multipart_upload()
- paws.storage::s3()$complete_multipart_upload()
- paws.storage::s3()$upload_part() The named arguments in ... must not be any of "bucket", "Bucket", "key", "Key", "prefix", "region", "part_size", "endpoint", "version", "VersionId", "body", "Body", "metadata", "Metadata", "UploadId", "MultipartUpload", or "PartNumber".

Details
See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Value
Object of class "tar_resources_aws", to be supplied to the aws argument of tar_resources().

Resources
Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner.
In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from `tar_option_get("resources")`. For example, suppose you set `tar_option_set(resources = tar_resources(aws = my_aws))`, where `my_aws` equals `tar_resources_aws(bucket = "x", prefix = "y")`. Then, `tar_target(data, get_data())` will have bucket "x" and prefix "y". In addition, if `new_resources` equals `tar_resources(aws = tar_resources_aws(bucket = "z"))`, then `tar_target(data, get_data(), resources = new_resources)` will use the new bucket "z", but it will still use the prefix "y" supplied through `tar_option_set()`. (In targets 0.12.1 and below, options like prefix do not carry over from `tar_option_set()` if you supply non-default resources to `tar_target()`.)

See Also

Other resources: `tar_resources()`, `tar_resources_clustermq()`, `tar_resources_aws()`, `tar_resources_crew()`, `tar_resources_feather()`, `tar_resources_fst()`, `tar_resources_future()`, `tar_resources_gcp()`, `tar_resources_network()`, `tar_resources_parquet()`, `tar_resources_qs()`, `tar_resources_url()`

Examples

```r
# Somewhere in you target script file (usually _targets.R):
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_target(
  name,
  command(),
  format = "qs",
  repository = "aws",
  resources = tar_resources(
    aws = tar_resources_aws(bucket = "yourbucketname"),
    qs = tar_resources_qs(preset = "fast")
  )
)
}
```

---

**tar_resources_clustermq**

*Target resources: clustermq high-performance computing*

Description

Create the `clustermq` argument of `tar_resources()` to specify optional high-performance computing settings for `tar_make_clustermq()`. For details, see the documentation of the `clustermq` R package and the corresponding argument names in this help file.

Usage

```r
tar_resources_clustermq(
  template = targets::tar_option_get("resources")$clustermq$template
)
```
Arguments

  template  Named list, template argument to clustermq::workers(). Defaults to an empty list.

Details

clustermq workers are persistent, so there is not a one-to-one correspondence between workers and targets. The clustermq resources apply to the workers, not the targets. So the correct way to assign clustermq resources is through `tar_option_set()`, not `tar_target()`. clustermq resources in individual `tar_target()` calls will be ignored.

Value

Object of class "tar_resources_clustermq", to be supplied to the clustermq argument of `tar_resources()`.

Resources

Functions `tar_target()` and `tar_option_set()` each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The `tar_resources()` function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from `tar_option_get("resources")`. For example, suppose you set `tar_option_set(resources = tar_resources(aws = my_aws))`, where `my_aws` equals `tar_resources_aws(bucket = "x", prefix = "y")`. Then, `tar_target(data, get_data())` will have bucket "x" and prefix "y". In addition, if `new_resources` equals `tar_resources(aws = tar_resources_aws(bucket = "z"))`, then `tar_target(data, get_data(), resources = new_resources)` will use the new bucket "z", but it will still use the prefix "y" supplied through `tar_option_set()`. (In targets 0.12.1 and below, options like prefix do not carry over from `tar_option_set()` if you supply non-default resources to `tar_target()`.)

See Also

Other resources: `tar_resources()`, `tar_resources_aws()`, `tar_resources_crew()`, `tar_resources_feather()`, `tar_resources_fst()`, `tar_resources_future()`, `tar_resources_gcp()`, `tar_resources_network()`, `tar_resources_parquet()`, `tar_resources_qs()`, `tar_resources_url()`

Examples

# Somewhere in you target script file (usually _targets.R):
  tar_target(
    name,
    command(),
    resources = tar_resources(
      clustermq = tar_resources_clustermq(template = list(n_cores = 2))
    )
  )
Description

Create the `crew` argument of `tar_resources()` to specify optional target settings.

Usage

```r
tar_resources_crew(
  controller = targets::tar_option_get("resources")$crew$controller,
  scale = NULL,
  seconds_timeout = targets::tar_option_get("resources")$crew$seconds_timeout
)
```

Arguments

- `controller` Character of length 1. If `tar_option_get("controller")` is a crew controller group, the controller argument of `tar_resources_crew()` indicates which controller in the controller group to use. If you need heterogeneous workers, you can leverage this argument to send different targets to different worker groups.
- `scale` Deprecated in version 1.3.0.9002 (2023-10-02). No longer necessary.
- `seconds_timeout` Positive numeric of length 1, optional task timeout passed to the `.timeout` argument of `mirai::mirai()` (after converting to milliseconds).

Details

`tar_resources_crew()` accepts target-specific settings for integration with the crew R package. These settings are arguments to the `push()` method of the controller or controller group object which control things like auto-scaling behavior and the controller to use in the case of a controller group.

Value

Object of class "tar_resources_crew", to be supplied to the `crew` argument of `tar_resources()`.

Resources

Functions `tar_target()` and `tar_option_set()` each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The `tar_resources()` function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from `tar_option_get("resources")`. For example, suppose you set `tar_option_set(resources = tar_resources(aws = my_aws))`, where `my_aws` equals `tar_resources_aws(bucket = "x", prefix = "y")`. Then, `tar_target(data, get_data())` will have bucket "x" and prefix "y". In addition,
if new_resources equals tar_resources(aws = tar_resources_aws(bucket = "z")), then
tar_target(data, get_data(), resources = new_resources) will use the new bucket "z", but
it will still use the prefix "y" supplied through tar_option_set(). (In targets 0.12.1 and below,
options like prefix do not carry over from tar_option_set() if you supply non-default resources
to tar_target().)

See Also

Other resources: tar_resources(), tar_resources_aws(), tar_resources_clustermq(), tar_resources_feather(),
tar_resources_fst(), tar_resources_future(), tar_resources_gcp(), tar_resources_network(),
tar_resources_parquet(), tar_resources_qs(), tar_resources_url()

Examples

# Somewhere in your target script file (usually _targets.R):
tar_target(
  name,
  command(),
  resources = tar_resources(
    crew = tar_resources_crew(seconds_timeout = 5)
  )
)

---

tar_resources_feather  Target resources: feather storage formats

Description

Create the feather argument of tar_resources() to specify optional settings for feather data frame
storage formats powered by the arrow R package. See the format argument of tar_target() for
details.

Usage

tar_resources_feather(
  compression = targets::tar_option_get("resources")$feather$compression,
  compression_level = targets::tar_option_get("resources")$feather$compression_level
)

Arguments

compression  Character of length 1, compression argument of arrow::write_feather().
 Defaults to "default".

compression_level  Numeric of length 1, compression_level argument of arrow::write_feather().
 Defaults to NULL.
Value

Object of class "tar_resources_feather", to be supplied to the feather argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from tar_option_get("resources"). For example, suppose you set

```r
  tar_option_set(resources = tar_resources(aws = my_aws))
```

where my_aws equals

```r
  tar_resources_aws(bucket = "x", prefix = "y")
```

Then, tar_target(data, get_data()) will have bucket "x" and prefix "y". In addition, if

```r
  new_resources = tar_resources(aws = tar_resources_aws(bucket = "z"))
```

then tar_target(data, get_data(), resources = new_resources) will use the new bucket "z", but it will still use the prefix "y" supplied through tar_option_set(). (In targets 0.12.1 and below, options like prefix do not carry over from tar_option_set() if you supply non-default resources to tar_target().)

See Also

Other resources: tar_resources(), tar_resources_aws(), tar_resources_clustermq(), tar_resources_crew(), tar_resources_fst(), tar_resources_future(), tar_resources_gcp(), tar_resources_network(), tar_resources_parquet(), tar_resources_qs(), tar_resources_url()

Examples

```r
# Somewhere in you target script file (usually _targets.R):

tar_target(
  name,
  command(),
  format = "feather",
  resources = tar_resources(
    feather = tar_resources_feather(compression = "lz4")
  )
)
```

---

tar_resources_fst  Target resources: fst storage formats

Description

Create the fst argument of tar_resources() to specify optional settings for big data frame storage formats powered by the fst R package. See the format argument of tar_target() for details.

Usage

```r
tar_resources_fst(compress = targets::tar_option_get("resources")$fst$compress)
```
tar_resources_fst

Arguments

compress Numeric of length 1, compress argument of fst::write_fst(). Defaults to 50.

Value

Object of class "tar_resources_fst", to be supplied to the fst argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from tar_option_get("resources"). For example, suppose you set tar_option_set(resources = tar_resources(aws = my_aws)), where my_aws equals tar_resources_aws(bucket = "x", prefix = "y"). Then, tar_target(data, get_data()) will have bucket "x" and prefix "y". In addition, if new_resources equals tar_resources(aws = tar_resources_aws(bucket = "z")), then tar_target(data, get_data(), resources = new_resources) will use the new bucket "z", but it will still use the prefix "y" supplied through tar_option_set(). (In targets 0.12.1 and below, options like prefix do not carry over from tar_option_set() if you supply non-default resources to tar_target().)

See Also

Other resources: tar_resources(), tar_resources_aws(), tar_resources_clustermq(), tar_resources_crew(), tar_resources_feather(), tar_resources_future(), tar_resources_gcp(), tar_resources_network(), tar_resources_parquet(), tar_resources_qs(), tar_resources_url()

Examples

# Somewhere in you target script file (usually _targets.R):
tar_target(  name,  command(),  format = "fst_tbl",  resources = tar_resources(    fst = tar_resources_fst(compress = 100)  ))
)
Description

Create the \texttt{future} argument of \texttt{tar_resources()} to specify optional high-performance computing settings for \texttt{tar_make_future()}. This is how to supply the \texttt{resources} argument of \texttt{future::future()} for targets. Resources supplied through \texttt{future::plan()} and \texttt{future::tweak()} are completely ignored. For details, see the documentation of the \texttt{future} R package and the corresponding argument names in this help file.

Usage

\begin{verbatim}
tar_resources_future(
  plan = NULL,
  resources = targets::tar_option_get("resources")$future$resources
)
\end{verbatim}

Arguments

\begin{itemize}
  \item \textbf{plan} A \texttt{future::plan()} object or \texttt{NULL}, a target-specific future plan. Defaults to \texttt{NULL}.
  \item \textbf{resources} Named list, \texttt{resources} argument to \texttt{future::future()}. This argument is not supported in some versions of future. For versions of future where resources is not supported, instead supply \texttt{resources} to \texttt{future::tweak()} and assign the returned plan to the \texttt{plan} argument of \texttt{tar_resources_future()}. The default value of \texttt{resources} in \texttt{tar_resources_future()} is an empty list.
\end{itemize}

Value

Object of class "\texttt{tar_resources_future}"\texttt{}, to be supplied to the \texttt{future} argument of \texttt{tar_resources()}.

Resources

Functions \texttt{tar_target()} and \texttt{tar_option_set()} each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The \texttt{tar_resources()} function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from \texttt{tar_option_get("resources")}. For example, suppose you set \texttt{tar_option_set(resources = tar_resources(aws = my_aws))}, where \texttt{my_aws} equals \texttt{tar_resources_aws(bucket = "x", prefix = "y")}. Then, \texttt{tar_target(data, get_data())} will have bucket "x" and prefix "y". In addition, if \texttt{new_resources} equals \texttt{tar_resources(aws = tar_resources_aws(bucket = "z"))}, then \texttt{tar_target(data, get_data(), resources = new_resources)} will use the new bucket "z", but it will still use the prefix "y" supplied through \texttt{tar_option_set()}. (In targets 0.12.1 and below, options like prefix do not carry over from \texttt{tar_option_set()} if you supply non-default resources to \texttt{tar_target()}.)

Examples

```r
# Somewhere in you target script file (usually _targets.R):

name, command(),
resources = tar_resources(
  future = tar_resources_future(resources = list(n_cores = 2))
)
```

---

**tar_resources_gcp**  
*Target resources: Google Cloud Platform (GCP) Google Cloud Storage (GCS)*

**Description**

Create the `gcp` argument of `tar_resources()` to specify optional settings for Google Cloud Storage for targets with `tar_target(..., repository = "gcp")`. See the `format` argument of `tar_target()` for details.

**Usage**

```r
tar_resources_gcp(
  bucket = targets::tar_option_get("resources")$gcp$bucket,
  prefix = targets::tar_option_get("resources")$gcp$prefix,
  predefined_acl = targets::tar_option_get("resources")$gcp$predefined_acl,
  max_tries = targets::tar_option_get("resources")$gcp$max_tries,
  verbose = targets::tar_option_get("resources")$gcp$verbose
)
```

**Arguments**

- **bucket**: Character of length 1, name of an existing bucket to upload and download the return values of the affected targets during the pipeline.
- **prefix**: Character of length 1, "directory path" in the bucket where your target object and metadata will go. Please supply an explicit prefix unique to your targets project. In the future, targets will begin requiring explicitly user-supplied prefixes. (This last note was added on 2023-08-24: targets version 1.2.2.9000.)
- **predefined_acl**: Character of length 1, user access to the object. See `?googleCloudStorageR::gcs_upload` for possible values. Defaults to "private".
max_tries Positive integer of length 1, number of tries accessing a network resource on GCP.

verbose Logical of length 1, whether to print extra messages like progress bars during uploads and downloads. Defaults to FALSE.

Details
See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Value
Object of class "tar_resources_gcp", to be supplied to the gcp argument of tar_resources().

Resources
Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from tar_option_get("resources"). For example, suppose you set tar_option_set(resources = tar_resources(aws = my_aws)), where my_aws equals tar_resources_aws(bucket = "x", prefix = "y"). Then, tar_target(data, get_data()) will have bucket "x" and prefix "y". In addition, if new_resources equals tar_resources(aws = tar_resources_aws(bucket = "z")), then tar_target(data, get_data(), resources = new_resources) will use the new bucket "z", but it will still use the prefix "y" supplied through tar_option_set(). (In targets 0.12.1 and below, options like prefix do not carry over from tar_option_set() if you supply non-default resources to tar_target().)

See Also
Other resources: tar_resources(), tar_resources_aws(), tar_resources_cluster()(), tar_resources_crew(), tar_resources_feather(), tar_resources_fst(), tar_resources_future(), tar_resources_network(), tar_resources_parquet(), tar_resources_qs(), tar_resources_url()

Examples
# Somewhere in you target script file (usually _targets.R):
tar_target(
  name, 
  command(), 
  format = "qs", 
  repository = "gcp", 
  resources = tar_resources( 
    gcp = tar_resources_gcp(bucket = "yourbucketname"), 
    qs = tar_resources_qs(preset = "fast") 
  )
)
Description

In high-performance computing on network file systems, if storage = "worker" in tar_target() or tar_option_set(), then targets waits for hashes to synchronize before continuing the pipeline. These resources control the retry mechanism.

Usage

tar_resources_network(
  max_tries = targets::tar_option_get("resources")$network$max_tries,
  seconds_interval = targets::tar_option_get("resources")$network$seconds_interval,
  seconds_timeout = targets::tar_option_get("resources")$network$seconds_timeout,
  verbose = targets::tar_option_get("resources")$network$verbose
)

Arguments

max_tries Positive integer of length 1. Max number of tries.
seconds_interval Positive numeric of length 1. Multiplier for the exponential backoff algorithm, and width of the jitter. Units of seconds.
seconds_timeout Positive numeric of length 1. Timeout length in seconds.
verbose Logical of length 1, whether to print informative console messages.

Value

Object of class "tar_resources_network", to be supplied to the network argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from tar_option_get("resources"). For example, suppose you set tar_option_set(resources = tar_resources(aws = my_aws)), where my_aws equals tar_resources_aws(bucket = "x", prefix = "y"). Then, tar_target(data, get_data()) will have bucket "x" and prefix "y". In addition, if new_resources equals tar_resources(aws = tar_resources_aws(bucket = "z")), then tar_target(data, get_data(), resources = new_resources) will use the new bucket "z", but it will still use the prefix "y" supplied through tar_option_set(). (In targets 0.12.1 and below, options like prefix do not carry over from tar_option_set() if you supply non-default resources to tar_target().)

Other resources: \texttt{tar_resources()}, \texttt{tar_resources_aws()}, \texttt{tar_resources_clustermq()}, \texttt{tar_resources_crew()}, \texttt{tar_resources_feather()}, \texttt{tar_resources_fst()}, \texttt{tar_resources_future()}, \texttt{tar_resources_gcp()}, \texttt{tar_resources_parquet()}, \texttt{tar_resources_qs()}, \texttt{tar_resources_url()}

Examples

\begin{verbatim}
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  # Somewhere in you target script file (usually _targets.R):
  
  tar_target(
    name = your_name,
    command = your_command(),
    storage = "worker",
    resources = tar_resources( 
      network = tar_resources_network(max_tries = 3)
    )
  )
}
\end{verbatim}

\section*{tar_resources_parquet \ Target resources: parquet storage formats}

\section*{Description}

Create the \texttt{parquet} argument of \texttt{tar_resources()} to specify optional settings for parquet data frame storage formats powered by the \texttt{arrow} R package. See the \texttt{format} argument of \texttt{tar_target()} for details.

\section*{Usage}

\begin{verbatim}
tar_resources_parquet(
  compression = targets::tar_option_get("resources")$parquet$compression,
  compression_level = targets::tar_option_get("resources")$parquet$compression_level
)
\end{verbatim}

\section*{Arguments}

\begin{itemize}
  \item \texttt{compression} Character of length 1, \texttt{compression} argument of \texttt{arrow::write_parquet()}. Defaults to "snappy".
  \item \texttt{compression_level} Numeric of length 1, \texttt{compression_level} argument of \texttt{arrow::write_parquet()}. Defaults to NULL.
\end{itemize}

\section*{Value}

Object of class "\texttt{tar_resources_parquet}", to be supplied to the \texttt{parquet} argument of \texttt{tar_resources()}. 
Resources

Functions `tar_target()` and `tar_option_set()` each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The `tar_resources()` function is a helper to supply those settings in the correct manner.

In `targets` version 0.12.2 and above, resources are inherited one-by-one in nested fashion from `tar_option_get("resources")`. For example, suppose you set `tar_option_set(resources = tar_resources(aws = my_aws))`, where `my_aws` equals `tar_resources_aws(bucket = "x", prefix = "y")`. Then, `tar_target(data, get_data())` will have bucket "x" and prefix "y". In addition, if `new_resources` equals `tar_resources(aws = tar_resources_aws(bucket = "z"))`, then `tar_target(data, get_data(), resources = new_resources)` will use the new bucket "z", but it will still use the prefix "y" supplied through `tar_option_set()`. (In `targets` 0.12.1 and below, options like prefix do not carry over from `tar_option_set()` if you supply non-default resources to `tar_target()`.)

See Also

Other resources: `tar_resources()`, `tar_resources_aws()`, `tar_resources_clustermq()`, `tar_resources_crew()`, `tar_resources_feather()`, `tar_resources_fst()`, `tar_resources_future()`, `tar_resources_gcp()`, `tar_resources_network()`, `tar_resources_qs()`, `tar_resources_url()`

Examples

```
# Somewhere in you target script file (usually _targets.R):

tar_target(
  name,
  command(),
  format = "parquet",
  resources = tar_resources(
    parquet = tar_resources_parquet(compression = "lz4")
  )
)
```

---

**tar_resources_qs**

*Target resources: qs storage formats*

Description

Create the `qs` argument of `tar_resources()` to specify optional settings for big data storage formats powered by the `qs` R package. See the `format` argument of `tar_target()` for details.

Usage

```r
tar_resources_qs(preset = targets::tar_option_get("resources")$qs$preset)
```

Arguments

`preset` Character of length 1, preset argument of `qs::qsave()`. Defaults to "high".
Value

Object of class "tar_resources_qs", to be supplied to the qs argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to supply non-default settings of various optional backends for data storage and high-performance computing. The tar_resources() function is a helper to supply those settings in the correct manner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from tar_option_get("resources"). For example, suppose you set tar_option_set(resources = tar_resources(aws = my_aws)), where my_aws equals tar_resources_aws(bucket = "x", prefix = "y"). Then, tar_target(data, get_data()) will have bucket "x" and prefix "y". In addition, if new_resources equals tar_resources(aws = tar_resources_aws(bucket = "z")), then tar_target(data, get_data(), resources = new_resources) will use the new bucket "z", but it will still use the prefix "y" supplied through tar_option_set(). (In targets 0.12.1 and below, options like prefix do not carry over from tar_option_set() if you supply non-default resources to tar_target().)

See Also

Other resources: tar_resources(), tar_resources_aws(), tar_resources_clustermq(), tar_resources_crew(), tar_resources_feather(), tar_resources_fst(), tar_resources_future(), tar_resources_gcp(), tar_resources_network(), tar_resources_parquet(), tar_resources_url()

Examples

# Somewhere in you target script file (usually _targets.R):
tar_target(
  name,
  command(),
  format = "qs",
  resources = tar_resources(
    qs = tar_resources_qs(preset = "fast")
  )
)
Usage

tar_resources_url(
    handle = targets::.tar_option_get("resources")$url$handle,
    max_tries = targets::.tar_option_get("resources")$url$max_tries,
    seconds_interval = targets::.tar_option_get("resources")$url$seconds_interval,
    seconds_timeout = targets::.tar_option_get("resources")$url$seconds_interval
)

Arguments

handle          Object returned by curl::new_handle or NULL. Defaults to NULL.
max_tries       Positive integer of length 1, maximum number of tries to access a URL.
seconds_interval Nonnegative numeric of length 1, number of seconds to wait between individual
                  retries while attempting to connect to the URL. Use tar_resources_network() instead.
seconds_timeout Nonnegative numeric of length 1, number of seconds to wait before timing out
                  while trying to connect to the URL. Use tar_resources_network() instead.

Value

Object of class "tar_resources_url", to be supplied to the url argument of tar_resources().

Resources

Functions tar_target() and tar_option_set() each takes an optional resources argument to
supply non-default settings of various optional backends for data storage and high-performance
computing. The tar_resources() function is a helper to supply those settings in the correct man-
ner.

In targets version 0.12.2 and above, resources are inherited one-by-one in nested fashion from
tar_option_get("resources"). For example, suppose you set tar_option_set(resources =
tar_resources(aws = my_aws)), where my_aws equals tar_resources_aws(bucket = "x", prefix
= "y"). Then, tar_target(data, get_data()) will have bucket "x" and prefix "y". In addition,
if new_resources equals tar_resources(aws = tar_resources_aws(bucket = "z")), then
tar_target(data, get_data(), resources = new_resources) will use the new bucket "z", but
it will still use the prefix "y" supplied through tar_option_set(). (In targets 0.12.1 and below,
options like prefix do not carry over from tar_option_set() if you supply non-default resources
to tar_target().)

Other resources: tar_resources(), tar_resources_aws(), tar_resources_clustermq(), tar_resources_crew(),
tar_resources_feather(), tar_resources_fst(), tar_resources_future(), tar_resources_gcp(),
tar_resources_network(), tar_resources_parquet(), tar_resources_qs()
Examples

if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
    # Somewhere in your target script file (usually _targets.R):
    tar_target(
        name,
        command(),
        format = "url",
        resources = tar_resources(
            url = tar_resources_url(handle = curl::new_handle())
        )
    )
}
Target script file

Every targets project requires a target script file. The target script file is usually a file called _targets.R. Functions tar_make() and friends look for the target script and run it to set up the pipeline just prior to the main task. Every target script file should run the following steps in the order below:

1. Package: load the targets package. This step is automatically inserted at the top of the target script file produced by tar_script() if library_targets is TRUE, so you do not need to explicitly include it in code.

2. Globals: load custom functions and global objects into memory. Usually, this section is a bunch of calls to source() that run scripts defining user-defined functions. These functions support the R commands of the targets.

3. Options: call tar_option_set() to set defaults for targets-specific settings such as the names of required packages. Even if you have no specific options to set, it is still recommended to call tar_option_set() in order to register the proper environment.

4. Targets: define one or more target objects using tar_target().

5. Pipeline: call list() to bring the targets from (3) together in a pipeline object. Every target script file must return a pipeline object, which usually means ending with a call to list(). In practice, (3) and (4) can be combined together in the same function call.

See Also

Other scripts: tar_edit(), tar_github_actions(), tar_helper(), tar_helper_raw(), tar_renv()

Examples

tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script() # Writes an example target script file.
# Writes a user-defined target script:
tar_script({
  x <- tar_target(x, 1 + 1)
  tar_option_set()
  list(x)
}, ask = FALSE)
writeLines(readLines("_targets.R"))
})
tar_seed_create

Create a seed for a target.

Description

Create a seed for a target.

Usage

tar_seed_create(name, global_seed = NULL)

Arguments

- **name**: Character of length 1, target name.
- **global_seed**: Integer of length 1, the overarching global pipeline seed which governs the seeds of all the targets. Set to NULL to default to tar_option_get("seed"). Set to NA to disable seed setting in targets and make tar_seed_create() return NA_integer_.

Value

Integer of length 1, the target seed.

Seeds

A target’s random number generator seed is a deterministic function of its name and the global pipeline seed from tar_option_get("seed"). Consequently,

1. Each target runs with a reproducible seed so that different runs of the same pipeline in the same computing environment produce identical results.
2. No two targets in the same pipeline share the same seed. Even dynamic branches have different names and thus different seeds.

You can retrieve the seed of a completed target with tar_meta(your_target, seed) and run tar_seed_set() on the result to locally recreate the target’s initial RNG state. tar_workspace() does this automatically as part of recovering a workspace.

RNG overlap

In theory, there is a risk that the pseudo-random number generator streams of different targets will overlap and produce statistically correlated results. (For a discussion of the motivating problem, see the Section 6: "Random-number generation" in the parallel package vignette: vignette(topic = "parallel", package = "parallel").) However, this risk is extremely small in practice, as shown by L’Ecuyer et al. (2017) doi:10.1016/j.matcom.2016.05.005 under “A single RNG with a ‘random’ seed for each stream” (Section 4: under “How to produce parallel streams and sub-streams”). targets and tarchetypes take the approach discussed in the aforementioned section
of the paper using the secretbase package by Charlie Gao (2024) doi:10.5281/zenodo.10553140. To generate the 32-bit integer seed argument of set.seed() for each target, secretbase generates a cryptographic SHA3 hash and robustly converts it to 32-bit output using the SHAKE256 extendable output function (XOF). secretbase uses algorithms from the Mbed TLS C library.

Other pseudo-random number generation: tar_seed_get(), tar_seed_set()

tar_seed_get

Get the random number generator seed of the target currently running.

Description

Get the random number generator seed of the target currently running.

Usage

```
tar_seed_get(default = 1L)
```

Arguments

default Integer, value to return if tar_seed_get() is called on its own outside a targets pipeline. Having a default lets users run things without tar_make(), which helps peel back layers of code and troubleshoot bugs.

Value

Integer of length 1. If invoked inside a targets pipeline, the return value is the seed of the target currently running, which is a deterministic function of the target name. Otherwise, the return value is default.

Seeds

A target’s random number generator seed is a deterministic function of its name and the global pipeline seed from tar_option_get("seed"). Consequently,
1. Each target runs with a reproducible seed so that
different runs of the same pipeline in the same computing
environment produce identical results.
2. No two targets in the same pipeline share the same seed.
   Even dynamic branches have different names and thus different seeds.

You can retrieve the seed of a completed target with \texttt{tar_meta(your_target, seed)} and run
\texttt{tar_seed_set()} on the result to locally recreate the target’s initial RNG state. \texttt{tar_workspace()} does this automatically as part of recovering a workspace.

RNG overlap

In theory, there is a risk that the pseudo-random number generator streams of different targets will overlap and produce statistically correlated results. (For a discussion of the motivating problem, see the Section 6: "Random-number generation" in the parallel package vignette: vignette(topic = "parallel", package = "parallel").) However, this risk is extremely small in practice, as shown by L’Ecuyer et al. (2017) doi:10.1016/j.matcom.2016.05.005 under "A single RNG with a ‘random’ seed for each stream" (Section 4: under "How to produce parallel streams and sub-streams"). targets and tarchetypes take the approach discussed in the aforementioned section of the paper using the secretbase package by Charlie Gao (2024) doi:10.5281/zenodo.10553140. To generate the 32-bit integer seed argument of \texttt{set.seed()} for each target, secretbase generates a cryptographic SHA3 hash and robustly converts it to 32-bit output using the SHAKE256 extendable output function (XOF). secretbase uses algorithms from the mbed TLS C library.

Other pseudo-random number generation: \texttt{tar_seed_create()}, \texttt{tar_seed_set()}

Examples

\begin{verbatim}
tar_seed_get()
tar_seed_get(default = 123L)
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir() # \texttt{tar_dir()} runs code from a temp dir for CRAN.
tar_script(tar_target(returns_seed, tar_seed_get()), ask = FALSE)
tar_make()
tar_read(returns_seed)
}
\end{verbatim}
tar_seed_set

Set a seed to run a target.

Description

tar_seed_set generates its own target-specific seeds using tar_seed_create(). Use tar_seed_set() to set one of these seeds in R.

Usage

tar_seed_set(seed)

Arguments

seed Integer of length 1, value of the seed to set with set.seed().

Details

tar_seed_set() gives the user-supplied seed to set.seed() and sets arguments kind = "default", normal.kind = "default", and sample.kind = "default".

Value

NULL (invisibly).

Seeds

A target's random number generator seed is a deterministic function of its name and the global pipeline seed from tar_option_get("seed"). Consequently,

1. Each target runs with a reproducible seed so that different runs of the same pipeline in the same computing environment produce identical results.
2. No two targets in the same pipeline share the same seed. Even dynamic branches have different names and thus different seeds.

You can retrieve the seed of a completed target with tar_meta(your_target, seed) and run tar_seed_set() on the result to locally recreate the target's initial RNG state. tar_workspace() does this automatically as part of recovering a workspace.

RNG overlap

In theory, there is a risk that the pseudo-random number generator streams of different targets will overlap and produce statistically correlated results. (For a discussion of the motivating problem, see the Section 6: "Random-number generation" in the parallel package vignette: vignette(topic = "parallel", package = "parallel").) However, this risk is extremely small in practice, as shown by L'Ecuyer et al. (2017) doi:10.1016/j.matcom.2016.05.005 under "A single RNG with
a 'random' seed for each stream" (Section 4: under "How to produce parallel streams and sub-streams"). targets and tarchetypes take the approach discussed in the aforementioned section of the paper using the secretbase package by Charlie Gao (2024) doi:10.5281/zenodo.10553140. To generate the 32-bit integer seed argument of set.seed() for each target, secretbase generates a cryptographic SHA3 hash and robustly converts it to 32-bit output using the SHAKE256 extendable output function (XOF). secretbase uses algorithms from the Mbed TLS C library.

Other pseudo-random number generation: tar_seed_create(), tar_seed_get()

Examples

```r
seed <- tar_seed_create("target_name")
seed
sample(10)
tar_seed_set(seed)
sample(10)
tar_seed_set(seed)
sample(10)
```

tar_sitrep

Show the cue-by-cue status of each target.

Description

For each target, report which cues are activated. Except for the never cue, the target will rerun in tar_make() if any cue is activated. The target is suppressed if the never cue is TRUE. See tar_cue() for details.

Usage

```r
tar_sitrep(
  names = NULL,
  fields = NULL,
  shortcut = targets::tar_config_get("shortcut"),
  reporter = targets::tar_config_get("reporter_outdated"),
  callr_function = callr::r,
  callr_arguments = targets::tar_callr_args_default(callr_function, reporter),
  envir = parent.frame(),
)```

```r
script = targets::tar_config_get("script"),
store = targets::tar_config_get("store")
)
```

**Arguments**

- **names**: Optional, names of the targets. If supplied, `tar_sitrep()` only returns metadata on these targets. You can supply symbols or tidyselect helpers like `starts_with()`.

- **fields**: Optional, names of columns/fields to select. If supplied, `tar_sitrep()` only returns the selected metadata columns. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`. The name column is always included first no matter what you select. Choices:
  - `name`: name of the target or global object.
  - `record`: Whether the record cue is activated: TRUE if the target is not in the metadata (`tar_meta()`), or if the target errored during the last `tar_make()`, or if the class of the target changed.
  - `always`: Whether mode in `tar_cue()` is "always". If TRUE, `tar_make()` always runs the target.
  - `never`: Whether mode in `tar_cue()` is "never". If TRUE, `tar_make()` will only run if the record cue activates.
  - `command`: Whether the target’s command changed since last time. Always TRUE if the record cue is activated. Otherwise, always FALSE if the command cue is suppressed.
  - `depend`: Whether the data/output of at least one of the target’s dependencies changed since last time. Dependencies are targets, functions, and global objects directly upstream. Call `tar_outdated(targets_only = FALSE)` or `tar_visnetwork(targets_only = FALSE)` to see exactly which dependencies are outdated. Always NA if the record cue is activated. Otherwise, always FALSE if the depend cue is suppressed.
  - `format`: Whether the storage format of the target is different from last time. Always NA if the record cue is activated. Otherwise, always FALSE if the format cue is suppressed.
  - `repository`: Whether the storage repository of the target is different from last time. Always NA if the record cue is activated. Otherwise, always FALSE if the format cue is suppressed.
  - `iteration`: Whether the iteration mode of the target is different from last time. Always NA if the record cue is activated. Otherwise, always FALSE if the iteration cue is suppressed.
  - `file`: Whether the file(s) with the target’s return value are missing or different from last time. Always NA if the record cue is activated. Otherwise, always FALSE if the file cue is suppressed.

- **shortcut**: Logical of length 1, how to interpret the names argument. If `shortcut` is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. `shortcut = TRUE` increases speed if there are a lot of up-to-date targets,
but it assumes all the dependencies are up to date, so please use with caution. Use with caution. shortcut = TRUE only works if you set names.

**reporter**
Character of length 1, name of the reporter to user. Controls how messages are printed as targets are checked. Choices:
- "silent": print nothing.
- "forecast": print running totals of the checked and outdated targets found so far.

**callr_function**
A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). callr_function needs to be NULL for interactive debugging, e.g. tar_option_set(debug = "your_target"). However, callr_function should not be NULL for serious reproducible work.

**callr_arguments**
A list of arguments to callr_function.

**envir**
An environment, where to run the target R script (default: _targets.R) if callr_function is NULL. Ignored if callr_function is anything other than NULL. callr_function should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc. The envir argument of tar_make() and related functions always overrides the current value of tar_option_get("envir") in the current R session just before running the target script file, so whenever you need to set an alternative envir, you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

**script**
Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

**store**
Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

**Details**

Caveats:
- **tar_cue()** allows you to change/suppress cues, so the return value will depend on the settings you supply to tar_cue().
- If a pattern tries to branches over a target that does not exist in storage, then the branches are omitted from the output.
- **tar_sitrep()** is myopic. It only considers what happens to the immediate target and its immediate upstream dependencies, and it makes no attempt to propagate invalidation downstream.
Value
A data frame with one row per target/object and one column per cue. Each element is a logical to indicate whether the cue is activated for the target. See the field argument in this help file for details.

Examples
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script({
  list(
    tar_target(x, seq_len(2)),
    tar_target(y, 2 * x, pattern = map(x))
  ), ask = FALSE)
tar_make()
tar_sitrep()
tar_meta(starts_with("y_")) # see also any_of()
})
}

---

**tar_skipped**  
*List skipped targets.*

Description
List targets whose progress is "skipped".

Usage
```
tar_skipped(names = NULL, store = targets::tar_config_get("store"))
```

Arguments
- **names** Optional, names of the targets. If supplied, the function restricts its output to these targets. You can supply symbols or tidyselect helpers like `any_of()` and `starts_with()`.
- **store** Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.
**tar_source**

Run R scripts.

**Description**

Run all the R scripts in a directory in the environment specified.

**Usage**

```r
tar_source(
  files = "R",
  envir = targets::tar_option_get("envir"),
  change_directory = FALSE
)
```

**Arguments**

- **files** Character vector of file and directory paths to look for R scripts to run. Paths must either be absolute paths or must be relative to the current working directory just before the function call.
- **envir** Environment to run the scripts. Defaults to `tar_option_get("envir")`, the environment of the pipeline.

**Value**

A character vector of skipped targets.

**See Also**

Other progress: `tar_canceled()`, `tar_completed()`, `tar_dispatched()`, `tar_errored()`, `tar_poll()`, `tar_progress()`, `tar_progress_branches()`, `tar_progress_summary()`, `tar_watch()`, `tar_watch_server()`, `tar_watch_ui()`

**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) {  # for CRAN
  tar_dir({  # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      list(
        tar_target(x, seq_len(2)),
        tar_target(y, 2 * x, pattern = map(x))
      ),
      ask = FALSE
    })
    tar_make()
    tar_skipped()
    tar_skipped(starts_with("y_")) # see also any_of()
  })
}
```
change_directory

Logical, whether to temporarily change the working directory to the directory of each R script before running it.

Details

tar_source() is a convenient way to load R scripts in _targets.R to make custom functions available to the pipeline. tar_source() recursively looks for files ending in .R or .r, and it runs each with eval(parse(text = readLines(script_file, warn = FALSE)), envir).

Value

NULL (invisibly)

Storage access

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the tarchetypes package such as tar_render() and tar_quarto().

Several functions like tar_make(), tar_read(), tar_load(), tar_meta(), and tar_progress() read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
  # Running in tar_dir(), these files are written in tempdir()
  dir.create("R")
  writeLines("f <- function(x) x + 1", file.path("R", "functions.R"))
  tar_script({
    tar_source()
    list(tar_target(x, f(1)))
  })
  tar_make()
  tar_read(x) # 2
})
**describe a target.**

**Description**

A target is a single step of computation in a pipeline. It runs an R command and returns a value. This value gets treated as an R object that can be used by the commands of targets downstream. Targets that are already up to date are skipped. See the user manual for more details.

**Usage**

```r
tar_target( 
  name, 
  command, 
  pattern = NULL, 
  tidy_eval = targets::tar_option_get("tidy_eval"), 
  packages = targets::tar_option_get("packages"), 
  library = targets::tar_option_get("library"), 
  format = targets::tar_option_get("format"), 
  repository = targets::tar_option_get("repository"), 
  iteration = targets::tar_option_get("iteration"), 
  error = targets::tar_option_get("error"), 
  memory = targets::tar_option_get("memory"), 
  garbage_collection = targets::tar_option_get("garbage_collection"), 
  deployment = targets::tar_option_get("deployment"), 
  priority = targets::tar_option_get("priority"), 
  resources = targets::tar_option_get("resources"), 
  storage = targets::tar_option_get("storage"), 
  retrieval = targets::tar_option_get("retrieval"), 
  cue = targets::tar_option_get("cue")
)
```

**Arguments**

- **name**
  Symbol, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. `tar_target(downstream_target, f(upstream_target))` is a target named `downstream_target` which depends on a target `upstream_target` and a function `f()`. In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with `tar_meta(your_target, seed)` and run `tar_seed_set()` on the result to locally recreate the target’s initial RNG state.

- **command**
  R code to run the target.
pattern Language to define branching for a target. For example, in a pipeline with numeric vector targets `x` and `y`, `tar_target(z, x + y, pattern = map(x, y))` implicitly defines branches of `z` that each compute `x[1] + y[1], x[2] + y[2],` and so on. See the user manual for details.

tidy_eval Logical, whether to enable tidy evaluation when interpreting command and pattern. If TRUE, you can use the "bang-bang" operator !! to programmatically insert the values of global objects.

packages Character vector of packages to load right before the target runs or the output data is reloaded for downstream targets. Use `tar_option_set()` to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.

format Optional storage format for the target’s return value. With the exception of `format = "file"`, each target gets a file in `_targets/objects`, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository Character of length 1, remote repository for target storage. Choices:

- "local": file system of the local machine.
- "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of `tar_resources_aws()`, but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
- "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration Character of length 1, name of the iteration mode of the target. Choices:

- "vector": branching happens with `vctrs::vec_slice()` and aggregation happens with `vctrs::vec_c()`.
- "list": branching happens with `[[[]]]` and aggregation happens with `list()`.
- "group": `dplyr::group_by()`-like functionality to branch over subsets of a non-dynamic data frame. For `iteration = "group"`, the target must not by dynamic (the `pattern` argument of `tar_target()` must be left NULL). The target’s return value must be a data frame with a special `tar_group` column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the `tar_group()` function to see how you can create the special `tar_group` column with `dplyr::group_by()`.

error Character of length 1, what to do if the target stops and throws an error. Options:

- "stop": the whole pipeline stops and throws an error.
- "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)

• "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

memory Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

garbage_collection Logical, whether to run base::gc() just before the target runs.

deployment Character of length 1. If deployment is "main", then the target will run on the central controlling R process. Otherwise, if deployment is "worker" and you set up the pipeline with distributed/parallel computing, then the target runs on a parallel worker. For more on distributed/parallel computing in targets, please visit https://books.ropensci.org/targets/crew.html.

priority Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get dispatched earlier (and polled earlier in tar_make_future()).

resources Object returned by tar_resources() with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See tar_resources() for details.

storage Character of length 1, only relevant to tar_make_clustermq() and tar_make_future(). Must be one of the following values:

• "main": the target's return value is sent back to the host machine and saved/uploaded locally.

• "worker": the worker saves/uploads the value.

• "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target's command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to the data store from inside the target.

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically
try to load the data from the data store as a dependency. As a corollary, `storage = "none"` is completely unnecessary if `format` is "file".

**retrieval**
Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target runs.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

**cue**
An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

**Value**
A target object. Users should not modify these directly, just feed them to `list()` in your target script file (default: `_targets.R`).

**Target objects**
Functions like `tar_target()` produce target objects, special objects with specialized sets of S3 classes. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**Storage formats**
- "rds": Default, uses `saveRDS()` and `readRDS()`. Should work for most objects, but slow.
- "qs": Uses `qs::qsave()` and `qs::qread()`. Should work for most objects, much faster than "rds". Optionally set the preset for `qsave()` through `tar_resources()` and `tar_resources_qs()`.
- "feather": Uses `arrow::write_feather()` and `arrow::read_feather()` (version 2.0). Much faster than "rds", but the value must be a data frame. Optionally set compression and compression_level in `arrow::write_feather()` through `tar_resources()` and `tar_resources_feather()`. Requires the arrow package (not installed by default).
- "parquet": Uses `arrow::write_parquet()` and `arrow::read_parquet()` (version 2.0). Much faster than "rds", but the value must be a data frame. Optionally set compression and compression_level in `arrow::write_parquet()` through `tar_resources()` and `tar_resources_parquet()`. Requires the arrow package (not installed by default).
- "fst": Uses `fst::write_fst()` and `fst::read_fst()`. Much faster than "rds", but the value must be a data frame. Optionally set the compression level for `fst::write_fst()` through `tar_resources()` and `tar_resources_fst()`. Requires the fst package (not installed by default).
• "fst_dt": Same as "fst", but the value is a data.table. Deep copies are made as appropriate in order to protect against the global effects of in-place modification. Optionally set the compression level the same way as for "fst".

• "fst_tbl": Same as "fst", but the value is a tibble. Optionally set the compression level the same way as for "fst".

• "keras": superseded by tar_format() and incompatible with error = "null" (in tar_target() or tar_option_set()). Uses keras::save_model_hdf5() and keras::load_model_hdf5(). The value must be a Keras model. Requires the keras package (not installed by default).

• "torch": superseded by tar_format() and incompatible with error = "null" (in tar_target() or tar_option_set()). Uses torch::torch_save() and torch::torch_load(). The value must be an object from the torch package such as a tensor or neural network module. Requires the torch package (not installed by default).

• "file": A dynamic file. To use this format, the target needs to manually identify or save some data and return a character vector of paths to the data (must be a single file path if repository is not "local"). (These paths must be existing files and nonempty directories.) Then, targets automatically checks those files and cues the appropriate run/skip decisions if those files are out of date. Those paths must point to files or directories, and they must not contain characters | or *. All the files and directories you return must actually exist, or else targets will throw an error. (And if storage is "worker", targets will first stall out trying to wait for the file to arrive over a network file system.) If the target does not create any files, the return value should be character(0).

If repository is not "local" and format is "file", then the character vector returned by the target must be of length 1 and point to a single file. (Directories and vectors of multiple file paths are not supported for dynamic files on the cloud.) That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

To check if the file is up to date, targets avoids timestamps and always recomputes the hash. If you find this to be too slow, and if you trust the time stamps on your file system (see the trust_object_timestamps argument of tar_option_set()), then consider format = "file_fast" instead.

• "file_fast": same as format = "file", except that targets uses time stamps to check if a file is up to date. If the time stamp of the file agrees with the time stamp in the metadata, the file is considered up to date. Otherwise, targets recomputes the hash of the file to make a final determination. Low-precision timestamps are not reliable for this, and some file systems have timestamp precision as poor as 2 seconds. See the trust_object_timestamps argument of tar_option_set() for advice on this.

• "url": A dynamic input URL. For this storage format, repository is implicitly "local", URL format is like format = "file" except the return value of the target is a URL that already exists and serves as input data for downstream targets. Optionally supply a custom curl handle through tar_resources() and tar_resources_url(). in new_handle(), nobody = TRUE is important because it ensures targets just downloads the metadata instead of the entire data file when it checks time stamps and hashes. The data file at the URL needs to have an ETag or a Last-Modified time stamp, or else the target will throw an error because it cannot track the data. Also, use extreme caution when trying to use format = "url" to track uploads. You must be absolutely certain the ETag and Last-Modified time stamp are fully updated and available by the time the target's command finishes running. targets makes no attempt to wait for the web server.
• A custom format can be supplied with `tar_format()`. For this choice, it is the user's responsibility to provide methods for (un)serialization and (un)marshaling the return value of the target.

• The formats starting with "aws_" are deprecated as of 2022-03-13 (targets version > 0.10.0). For cloud storage integration, use the repository argument instead.

Examples

```r
# Defining targets does not run them.
data <- tar_target(target_name, get_data(), packages = "tidyverse")
analysis <- tar_target(analysis, analyze(x), pattern = map(x))

# Pipelines accept targets.
pipeline <- list(data, analysis)
# Tidy evaluation

# tar_option_set(envir = environment())
n_rows <- 30L
data <- tar_target(target_name, get_data(n_rows))
print(data)
# Disable tidy evaluation:
data <- tar_target(target_name, get_data(n_rows), tidy_eval = FALSE)
print(data)
tar_option_reset()

# In a pipeline:
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(tar_target(x, 1 + 1), ask = FALSE)
tar_make()
tar_read(x)
})
} 
```
Usage

tar_target_raw(
  name,
  command,
  pattern = NULL,
  packages = targets::tar_option_get("packages"),
  library = targets::tar_option_get("library"),
  deps = NULL,
  string = NULL,
  format = targets::tar_option_get("format"),
  repository = targets::tar_option_get("repository"),
  iteration = targets::tar_option_get("iteration"),
  error = targets::tar_option_get("error"),
  memory = targets::tar_option_get("memory"),
  garbage_collection = targets::tar_option_get("garbage_collection"),
  deployment = targets::tar_option_get("deployment"),
  priority = targets::tar_option_get("priority"),
  resources = targets::tar_option_get("resources"),
  storage = targets::tar_option_get("storage"),
  retrieval = targets::tar_option_get("retrieval"),
  cue = targets::tar_option_get("cue")
)

Arguments

name Character of length 1, name of the target. A target name must be a valid name for a symbol in R, and it must not start with a dot. Subsequent targets can refer to this name symbolically to induce a dependency relationship: e.g. tar_target(downstream_target, f(upstream_target)) is a target named downstream_target which depends on a target upstream_target and a function f(). In addition, a target’s name determines its random number generator seed. In this way, each target runs with a reproducible seed so someone else running the same pipeline should get the same results, and no two targets in the same pipeline share the same seed. (Even dynamic branches have different names and thus different seeds.) You can recover the seed of a completed target with tar_meta(your_target, seed) and run tar_seed_set() on the result to locally recreate the target’s initial RNG state.

command Similar to the command argument of tar_target() except the object must already be an expression instead of informally quoted code. base::expression() and base::quote() can produce such objects.

pattern Similar to the pattern argument of tar_target() except the object must already be an expression instead of informally quoted code. base::expression() and base::quote() can produce such objects.

packages Character vector of packages to load right before the target runs or the output data is reloaded for downstream targets. Use tar_option_set() to set packages globally for all subsequent targets you define.

library Character vector of library paths to try when loading packages.
deps
Optional character vector of the adjacent upstream dependencies of the target, including targets and global objects. If NULL, dependencies are resolved automatically as usual. The deps argument is only for developers of extension packages such as tarctypes, not for end users, and it should almost never be used at all. In scenarios that at first appear to requires deps, there is almost always a simpler and more robust workaround that avoids setting deps.

string
Optional string representation of the command. Internally, the string gets hashed to check if the command changed since last run, which helps targets decide whether the target is up to date. External interfaces can take control of string to ignore changes in certain parts of the command. If NULL, the strings is just deparsed from command (default).

format
Optional storage format for the target’s return value. With the exception of format = “file”, each target gets a file in _targets/objects, and each format is a different way to save and load this file. See the "Storage formats" section for a detailed list of possible data storage formats.

repository
Character of length 1, remote repository for target storage. Choices:

• "local": file system of the local machine.
• "aws": Amazon Web Services (AWS) S3 bucket. Can be configured with a non-AWS S3 bucket using the endpoint argument of tar_resources_aws(), but versioning capabilities may be lost in doing so. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.
• "gcp": Google Cloud Platform storage bucket. See the cloud storage section of https://books.ropensci.org/targets/data.html for details for instructions.

Note: if repository is not "local" and format is "file" then the target should create a single output file. That output file is uploaded to the cloud and tracked for changes where it exists in the cloud. The local file is deleted after the target runs.

iteration
Character of length 1, name of the iteration mode of the target. Choices:

• "vector": branching happens with vctrs::vec_slice() and aggregation happens with vctrs::vec_c().
• "list": branching happens with [[]] and aggregation happens with list().
• "group": dplyr::group_by()-like functionality to branch over subsets of a non-dynamic data frame. For iteration = "group", the target must not by dynamic (the pattern argument of tar_target() must be left NULL). The target’s return value must be a data frame with a special tar_group column of consecutive integers from 1 through the number of groups. Each integer designates a group, and a branch is created for each collection of rows in a group. See the tar_group() function to see how you can create the special tar_group column with dplyr::group_by().

error
Character of length 1, what to do if the target stops and throws an error. Options:

• "stop": the whole pipeline stops and throws an error.
• "continue": the whole pipeline keeps going.
• "abridge": any currently running targets keep running, but no new targets launch after that. (Visit https://books.ropensci.org/targets/debugging.html to learn how to debug targets using saved workspaces.)

• "null": The errored target continues and returns NULL. The data hash is deliberately wrong so the target is not up to date for the next run of the pipeline.

**memory**

Character of length 1, memory strategy. If "persistent", the target stays in memory until the end of the pipeline (unless storage is "worker", in which case targets unloads the value from memory right after storing it in order to avoid sending copious data over a network). If "transient", the target gets unloaded after every new target completes. Either way, the target gets automatically loaded into memory whenever another target needs the value. For cloud-based dynamic files (e.g. format = "file" with repository = "aws"), this memory strategy applies to the temporary local copy of the file: "persistent" means it remains until the end of the pipeline and is then deleted, and "transient" means it gets deleted as soon as possible. The former conserves bandwidth, and the latter conserves local storage.

**garbage_collection**

Logical, whether to run `base::gc()` just before the target runs.

**deployment**

Character of length 1. If deployment is "main", then the target will run on the central controlling R process. Otherwise, if deployment is "worker" and you set up the pipeline with distributed/parallel computing, then the target runs on a parallel worker. For more on distributed/parallel computing in targets, please visit https://books.ropensci.org/targets/crew.html.

**priority**

Numeric of length 1 between 0 and 1. Controls which targets get deployed first when multiple competing targets are ready simultaneously. Targets with priorities closer to 1 get dispatched earlier (and polled earlier in `tar_make_future()`).

**resources**

Object returned by `tar_resources()` with optional settings for high-performance computing functionality, alternative data storage formats, and other optional capabilities of targets. See `tar_resources()` for details.

**storage**

Character of length 1, only relevant to `tar_make_clustermq()` and `tar_make_future()`. Must be one of the following values:

- "main": the target's return value is sent back to the host machine and saved/uploaded locally.
- "worker": the worker saves/uploads the value.
- "none": almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language. If you do use it, then the return value of the target is totally ignored when the target ends, but each downstream target still attempts to load the data file (except when retrieval = "none").

If you select storage = "none", then the return value of the target's command is ignored, and the data is not saved automatically. As with dynamic files (format = "file") it is the responsibility of the user to write to the data store from inside the target.

The distinguishing feature of storage = "none" (as opposed to format = "file") is that in the general case, downstream targets will automatically
try to load the data from the data store as a dependency. As a corollary, `storage = "none"` is completely unnecessary if `format` is "file".

**retrieval**
Character of length 1, only relevant to `tar_make_cluster(q)` and `tar_make_future()`. Must be one of the following values:
- "main": the target’s dependencies are loaded on the host machine and sent to the worker before the target runs.
- "worker": the worker loads the targets dependencies.
- "none": the dependencies are not loaded at all. This choice is almost never recommended. It is only for niche situations, e.g. the data needs to be loaded explicitly from another language.

**cue**
An optional object from `tar_cue()` to customize the rules that decide whether the target is up to date.

**Value**
A target object. Users should not modify these directly, just feed them to `list()` in your target script file (default: `_targets.R`). See the "Target objects" section for details.

**Target objects**
Functions like `tar_target()` produce target objects, special objects with specialized sets of S3 classes. Target objects represent skippable steps of the analysis pipeline as described at [https://books.ropensci.org/targets/](https://books.ropensci.org/targets/). Please read the walkthrough at [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html) to understand the role of target objects in analysis pipelines.

For developers, [https://wlandau.github.io/targetopia/contributing.html#target-factories](https://wlandau.github.io/targetopia/contributing.html#target-factories) explains target factories (functions like this one which generate targets) and the design specification at [https://books.ropensci.org/targets-design/](https://books.ropensci.org/targets-design/) details the structure and composition of target objects.

**See Also**
Other targets: `tar_cue()`, `tar_format()`, `tar_target()`

**Examples**

```r
# The following are equivalent.
y <- tar_target(y, sqrt(x), pattern = map(x))
y <- tar_target_raw("y", expression(sqrt(x)), expression(map(x)))
# Programmatically create a chain of interdependent targets
target_list <- lapply(seq_len(4), function(i) {
  tar_target_raw(
    letters[i + 1],
    substitute(do_something(x), env = list(x = as.symbol(letters[i])))
  )
})
print(target_list[[1]])
print(target_list[[2]])
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
```

tar_test

Test code in a temporary directory.

Description

Runs a test_that() unit test inside a temporary directory to avoid writing to the user’s file space. This helps ensure compliance with CRAN policies. Also isolates tar_option_set() options and environment variables specific to targets and skips the test on Solaris. Useful for writing tests for targetopia packages (extensions to targets tailored to specific use cases).

Usage

tar_test(label, code)

Arguments

label  Character of length 1, label for the test.

code  User-defined code for the test.

Value

NULL (invisibly).

See Also

Other utilities to extend targets: tar_assert, tar_condition, tar_language

Examples

tar_test("example test", {
    testing_variable_cafecfcb <- "only defined inside tar_test()"
    file.create("only_exists_in_tar_test")
})
exists("testing_variable_cafecfcb")
file.exists("only_exists_in_tar_test")
Get the timestamp(s) of a target.

Description

Get the timestamp associated with a target’s last successful run.

Usage

```r
tar_timestamp(
  name = NULL,
  format = NULL,
  tz = NULL,
  parse = NULL,
  store = targets::tar_config_get("store")
)
```

Arguments

- `name` Symbol, name of the target. If `NULL` (default) then `tar_timestamp()` will attempt to return the timestamp of the target currently running. Must be called inside a target’s command or a supporting function in order to work.
- `format` Deprecated in `targets` version 0.6.0 (2021-07-21).
- `tz` Deprecated in `targets` version 0.6.0 (2021-07-21).
- `parse` Deprecated in `targets` version 0.6.0 (2021-07-21).
- `store` Character of length 1, path to the `targets` data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

tar_timestamp() checks the metadata in `_targets/meta/meta`, not the actual returned data of the target. The timestamp depends on the storage format of the target. If storage is local, e.g. formats like "rds" and "file", then the time stamp is the latest modification time of the target data files at the time the target last successfully ran. For non-local storage as with `repository = "aws"` and `format = "url"`, `targets` chooses instead to simply record the time the target last successfully ran.

Value

If the target is not recorded in the metadata or cannot be parsed correctly, then `tar_timestamp()` returns a POSIXct object at `1970-01-01` UTC.

See Also

Other time: `tar_newer()`, `tar_older()`, `tar_timestamp_raw()`
**Examples**

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(
    list(tar_target(x, 1))
), ask = FALSE)
tar_make()
# Get the timestamp.
tar_timestamp(x)
# We can use the timestamp to cancel the target
# if it already ran within the last hour.
# Be sure to set "cue = tar_cue(mode = "always")".
# if you want the target to always check the timestamp.
tar_script({
    list(
        tar_target(
            x,
            tar_cancel((Sys.time() - tar_timestamp()) < 3600),
            cue = tar_cue(mode = "always")
        )
    ), ask = FALSE)
tar_make()
})
}
```

---

**Description**

Get the time that a target last ran successfully.

**Usage**

```r
tar_timestamp_raw(
    name = NULL,
    format = NULL,
    tz = NULL,
    parse = NULL,
    store = targets::tar_config_get("store")
)
```

**Arguments**

- `name`: Character of length 1, name of the target.
- `format`: Deprecated in targets version 0.6.0 (2021-07-21).
- `tz`: Deprecated in targets version 0.6.0 (2021-07-21).
- `parse`: Deprecated in targets version 0.6.0 (2021-07-21).
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Details

tar_timestamp_raw() is like tar_timestamp() except it accepts a character string for name instead of a symbol. tar_timestamp_raw() checks the metadata in _targets/meta/meta, not the actual data. Time stamps are recorded only for targets that run commands: just non-branching targets and individual dynamic branches.

Value

If the target is not recorded in the metadata or cannot be parsed correctly, then tar_timestamp_raw() returns a POSIXct object at 1970-01-01 UTC.

See Also

Other time: tar_newer(), tar_older(), tar_timestamp()

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(
  list(tar_target(x, 1))
}, ask = FALSE)
tar_make()
# Get the timestamp.
tar_timestamp_raw("x")
# We can use the timestamp to cancel the target
# if it already ran within the last hour.
# Be sure to set `cue = tar_cue(mode = "always")`
# if you want the target to always check the timestamp.
tar_script(
  list(
    tar_target(
      x,
      tar_cancel((Sys.time() - tar_timestamp_raw()) < 3600),
      cue = tar_cue(mode = "always")
    )
  ), ask = FALSE)
tar_make()
}
```
**tar_toggle**  
Choose code to run based on Target Markdown mode.

### Description
Run one piece of code if Target Markdown mode interactive mode is turned on and another piece of code otherwise.

### Usage
```
tar_toggle(interactive, noninteractive)
```

### Arguments
- **interactive**: R code to run if Target Markdown interactive mode is activated.
- **noninteractive**: R code to run if Target Markdown interactive mode is not activated.

### Details
Visit [books.ropensci.org/targets/literate-programming.html](books.ropensci.org/targets/literate-programming.html) to learn about Target Markdown and interactive mode.

### Value
If Target Markdown interactive mode is not turned on, the function returns the result of running the code. Otherwise, the function invisibly returns `NULL`.

### See Also
Other Target Markdown: `tar_engine_knitr()`, `tar_interactive()`, `tar_noninteractive()`

### Examples
```
tar_toggle(  
  message("In interactive mode."),  
  message("Not in interactive mode.")
)
```
**tar_traceback**

*Get a target’s traceback*

**Description**

Return the saved traceback of a target. Assumes the target errored out in a previous run of the pipeline with workspaces enabled for that target. See `tar_workspace()` for details.

**Usage**

```r
tar_traceback(
  name,
  envir = NULL,
  packages = NULL,
  source = NULL,
  characters = NULL,
  store = targets::tar_config_get("store")
)
```

**Arguments**

- **name**
  - Symbol, name of the target whose workspace to read.
- **envir**
  - Deprecated in targets > 0.3.1 (2021-03-28).
- **packages**
  - Logical, whether to load the required packages of the target.
- **source**
  - Logical, whether to run the target script file (default: `_targets.R`) to load user-defined global object dependencies into `envir`. If TRUE, then `envir` should either be the global environment or inherit from the global environment.
- **characters**
  - Deprecated in targets 1.4.0 (2023-12-06).
- **store**
  - Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

Character vector, the traceback of a failed target if it exists.

**See Also**

Other debug: `tar_load_globals()`, `tar_workspace()`, `tar_workspaces()`
Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tmp <- sample(1)
tar_script({
  tar_option_set(workspace_on_error = TRUE)
  list(
    tar_target(x, "loaded"),
    tar_target(y, stop(x))
  ), ask = FALSE)
  try(tar_make())
tar_traceback(y, characters = 60)
})
}
```

```
.tar_unscript

Remove target script helper files.
```

Description

Remove target script helper files (default: \_targets\_r/) that were created by Target Markdown.

Usage

```r
tar_unscript(script = targets::tar_config_get("script"))
```

Arguments

- `script` Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to _targets.R. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

Details

Target Markdown code chunks create R scripts in a folder called \_targets\_r/ in order to aid the automatically supplied \_targets.R file. Over time, the number of script files starts to build up, and targets has no way of automatically removing helper script files that are no longer necessary. To keep your pipeline up to date with the code chunks in the Target Markdown document(s), it is good practice to call `tar_unscript()` at the beginning of your first Target Markdown document. That way, extraneous/discarded targets are automatically removed from the pipeline when the document starts render.

If the target script is at some alternative path, e.g. custom/script.R, the helper scripts are in custom/script_r/. `tar_unscript()` works on the helper scripts as long as your project configuration settings correctly identify the correct target script.
**tar_unversion**

**Value**

NULL (invisibly).

**Examples**

```r
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    tar_unscript()
})
```

**Description**

Delete version IDs from local metadata.

**Usage**

```r
tar_unversion(
    names = tidyselect::everything(),
    store = targets::tar_config_get("store")
)
```

**Arguments**

- **names** Tidyselect expression to identify the targets to drop version IDs.
- **store** Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

NULL (invisibly).

**Cloud target data versioning**

Some buckets in Amazon S3 or Google Cloud Storage are "versioned", which means they track historical versions of each data object. If you use targets with cloud storage (https://books.ropensci.org/targets/cloud-storage.html) and versioning is turned on, then targets will record each version of each target in its metadata.

Functions like `tar_read()` and `tar_load()` load the version recorded in the local metadata, which may not be the same as the “current” version of the object in the bucket. Likewise, functions `tar_delete()` and `tar_destroy()` only remove the version ID of each target as recorded in the local metadata.

If you want to interact with the latest version of an object instead of the version ID recorded in the local metadata, then you will need to delete the object from the metadata.
1. Make sure your local copy of the metadata is current and up to date. You may need to run `tar_meta_download()` or `tar_meta_sync()` first.

2. Run `tar_unversion()` to remove the recorded version IDs of your targets in the local metadata.

3. With the version IDs gone from the local metadata, functions like `tar_read()` and `tar_destroy()` will use the latest version of each target data object.

4. Optional: to back up the local metadata file with the version IDs deleted, use `tar_meta_upload()`.

### See Also

Other clean: `tar_delete()`, `tar_destroy()`, `tar_invalidate()`, `tar_prune()`, `tar_prune_list()`

---

**tar_validate**

Validate a pipeline of targets.

---

**Description**

Inspect the pipeline for issues and throw an error or warning if a problem is detected.

**Usage**

```r
 tar_validate(
   callr_function = callr::r,
   callr_arguments = targets::tar_callr_args_default(callr_function),
   envir = parent.frame(),
   script = targets::tar_config_get("script"),
   store = targets::tar_config_get("store")
)
```

**Arguments**

- `callr_function` A function from `callr` to start a fresh clean R process to do the work. Set to `NULL` to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be `NULL` for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be `NULL` for serious reproducible work.

- `callr_arguments` A list of arguments to `callr_function`.

- `envir` An environment, where to run the target R script (default: `.targets.R`) if `callr_function` is `NULL`. Ignored if `callr_function` is anything other than `NULL`. `callr_function` should only be `NULL` for debugging and testing purposes, not for serious runs of a pipeline, etc.

The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir`,
you should always set it with tar_option_set() from within the target script file. In other words, if you call tar_option_set(envir = envir1) in an interactive session and then tar_make(envir = envir2, callr_function = NULL), then envir2 will be used.

script
Character of length 1, path to the target script file. Defaults to tar_config_get("script"), which in turn defaults to _targets.R. When you set this argument, the value of tar_config_get("script") is temporarily changed for the current function call. See tar_script(), tar_config_get(), and tar_config_set() for details about the target script file and how to set it persistently for a project.

store
Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value
NULL except if callr_function = callr::r_bg(), in which case a handle to the callr background process is returned. Either way, the value is invisibly returned.

See Also
Other inspect: tar_deps(), tar_deps_raw(), tar_manifest(), tar_network(), tar_outdated(), tar_sitrep()

Examples
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(list(tar_target(x, 1 + 1)), ask = FALSE)
tar_validate()
})
}

Description
Visualize the pipeline dependency graph with a visNetwork HTML widget.

Usage
tar_visnetwork(
  targets_only = FALSE,
  names = NULL,
  shortcut = FALSE,
allow = NULL,
exclude = ".Random.seed",
outdated = TRUE,
label = targets::tar_config_get("label"),
level_separation = targets::tar_config_get("level_separation"),
degree_from = 1L,
degree_to = 1L,
zoom_speed = 1,
physics = FALSE,
reporter = targets::tar_config_get("reporter_outdated"),
seconds_reporter = targets::tar_config_get("seconds_reporter"),
callr_function = callr::r,
callr_arguments = targets::tar_callr_args_default(callr_function),
envir = parent.frame(),
script = targets::tar_config_get("script"),
store = targets::tar_config_get("store")
)

Arguments

**targets_only** Logical, whether to restrict the output to just targets (FALSE) or to also include global functions and objects.

**names** Names of targets. The graph visualization will operate only on these targets (and unless shortcut is TRUE, all the targets upstream as well). Selecting a small subgraph using names could speed up the load time of the visualization. Unlike allow, names is invoked before the graph is generated. Set to NULL to check/run all the targets (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with(). Applies to ordinary targets (stem) and whole dynamic branching targets (patterns) but not individual dynamic branches.

**shortcut** Logical of length 1, how to interpret the names argument. If shortcut is FALSE (default) then the function checks all targets upstream of names as far back as the dependency graph goes. If TRUE, then the function only checks the targets in names and uses stored metadata for information about upstream dependencies as needed. shortcut = TRUE increases speed if there are a lot of up-to-date targets, but it assumes all the dependencies are up to date, so please use with caution. Also, shortcut = TRUE only works if you set names.

**allow** Optional, define the set of allowable vertices in the graph. Unlike names, allow is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to allow all vertices in the pipeline and environment (default). Otherwise, you can supply symbols or tidyselect helpers like starts_with().

**exclude** Optional, define the set of exclude vertices from the graph. Unlike names, exclude is invoked only after the graph is mostly resolved, so it will not speed up execution. Set to NULL to exclude no vertices. Otherwise, you can supply symbols or tidyselect helpers like any_of() and starts_with().

**outdated** Logical, whether to show colors to distinguish outdated targets from up-to-date targets. (Global functions and objects still show these colors.) Looking for outdated targets takes a lot of time for large pipelines with lots of branches, and
setting outdated to FALSE is a nice way to speed up the graph if you only want to see dependency relationships and pipeline progress.

**label**
Character vector of one or more aesthetics to add to the vertex labels. Can contain "time" to show total runtime, "size" to show total storage size, or "branches" to show the number of branches in each pattern. You can choose multiple aesthetics at once, e.g. `label = c("time", "branches")`. All are disabled by default because they clutter the graph.

**level_separation**
Numeric of length 1, `levelSeparation` argument of `visNetwork::visHierarchicalLayout()`. Controls the distance between hierarchical levels. Consider changing the value if the aspect ratio of the graph is far from 1. If `level_separation` is NULL, the `levelSeparation` argument of `visHierarchicalLayout()` defaults to 150.

**degree_from**
Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. `degree_from` controls the number of edges the neighborhood extends upstream.

**degree_to**
Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. `degree_to` controls the number of edges the neighborhood extends downstream.

**zoom_speed**
Positive numeric of length 1, scaling factor on the zoom speed. Above 1 zooms faster than default, below 1 zooms lower than default.

**physics**
Logical of length 1, whether to implement interactive physics in the graph, e.g. edge elasticity.

**reporter**
Character of length 1, name of the reporter to user. Controls how messages are printed as targets are checked. Choices:
- "silent": print nothing.
- "forecast": print running totals of the checked and outdated targets found so far.

**seconds_reporter**
Positive numeric of length 1 with the minimum number of seconds between times when the reporter prints progress messages to the R console.

**callr_function**
A function from callr to start a fresh clean R process to do the work. Set to NULL to run in the current session instead of an external process (but restart your R session just before you do in order to clear debris out of the global environment). `callr_function` needs to be NULL for interactive debugging, e.g. `tar_option_set(debug = "your_target")`. However, `callr_function` should not be NULL for serious reproducible work.

**callr_arguments**
A list of arguments to `callr_function`.

**envir**
An environment, where to run the target R script (default: `.targets.R`) if `callr_function` is NULL. Ignored if `callr_function` is anything other than NULL. `callr_function` should only be NULL for debugging and testing purposes, not for serious runs of a pipeline, etc.

The `envir` argument of `tar_make()` and related functions always overrides the current value of `tar_option_get("envir")` in the current R session just before running the target script file, so whenever you need to set an alternative `envir`,...
you should always set it with `tar_option_set()` from within the target script file. In other words, if you call `tar_option_set(envir = envir1)` in an interactive session and then `tar_make(envir = envir2, callr_function = NULL)`, then `envir2` will be used.

**script**

Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

**store**

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

**Value**

A `visNetwork` HTML widget object.

**Dependency graph**

The dependency graph of a pipeline is a directed acyclic graph (DAG) where each node indicates a target or global object and each directed edge indicates where a downstream node depends on an upstream node. The DAG is not always a tree, but it never contains a cycle because no target is allowed to directly or indirectly depend on itself. The dependency graph should show a natural progression of work from left to right. `targets` uses static code analysis to create the graph, so the order of `tar_target()` calls in the `_targets.R` file does not matter. However, targets does not support self-referential loops or other cycles. For more information on the dependency graph, please read https://books.ropensci.org/targets/targets.html#dependencies.

**Storage access**

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline. The local data store is in flux while a pipeline is running, and depending on how distributed computing or cloud computing is set up, not all targets can even reach it. So please do not call these functions from inside a target as part of a running pipeline. The only exception is literate programming target factories in the `tarchetypes` package such as `tar_render()` and `tar_quarto()`.

Several functions like `tar_make()`, `tar_read()`, `tar_load()`, `tar_meta()`, and `tar_progress()` read or modify the local data store of the pipeline.   tar_visnetwork(allow = starts_with("y")) # see also any_of()
}
```

tar_watch

*Shiny app to watch the dependency graph.*

Description

Launches a background process with a Shiny app that calls `tar_visnetwork()` every few seconds. To embed this app in other apps, use the Shiny module in `tar_watch_ui()` and `tar_watch_server()`.

Usage

```r
tar_watch(
  seconds = 10,
  seconds_min = 1,
  seconds_max = 60,
  seconds_step = 1,
  targets_only = FALSE,
  exclude = ".Random.seed",
  outdated = FALSE,
  label = NULL,
  level_separation = 150,
  degree_from = 1L,
  degree_to = 1L,
  config = Sys.getenv("TAR_CONFIG", ".targets.yaml"),
  project = Sys.getenv("TAR_PROJECT", "main"),
  height = "650px",
  display = "summary",
  displays = c("summary", "branches", "progress", "graph", "about"),
  background = TRUE,
  browse = TRUE,
  host = getOption("shiny.host", "127.0.0.1"),
  port = getOption("shiny.port", targets::tar_random_port()),
  verbose = TRUE,
)```
supervise = TRUE,
poll_connection = TRUE,
stdout = "|",
stderr = "|"
)

Arguments

seconds     Numeric of length 1, default number of seconds between refreshes of the graph. Can be changed in the app controls.
seconds_min Numeric of length 1, lower bound of seconds in the app controls.
seconds_max Numeric of length 1, upper bound of seconds in the app controls.
seconds_step Numeric of length 1, step size of seconds in the app controls.
targets_only Logical, whether to restrict the output to just targets (FALSE) or to also include global functions and objects.
exclude     Character vector of nodes to omit from the graph.
outdated Logical, whether to show colors to distinguish outdated targets from up-to-date targets. (Global functions and objects still show these colors.) Looking for outdated targets takes a lot of time for large pipelines with lots of branches, and setting outdated to FALSE is a nice way to speed up the graph if you only want to see dependency relationships and pipeline progress.
label       Label argument to tar_visnetwork().
level_separation Numeric of length 1, levelSeparation argument of visNetwork::visHierarchicalLayout(). Controls the distance between hierarchical levels. Consider changing the value if the aspect ratio of the graph is far from 1. If level_separation is NULL, the levelSeparation argument of visHierarchicalLayout() defaults to 150.
degree_from Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_from controls the number of edges the neighborhood extends upstream.
degree_to   Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_to controls the number of edges the neighborhood extends downstream.
config      Character of length 1, file path of the YAML configuration file with targets project settings. The config argument specifies which YAML configuration file that tar_config_get() reads from or tar_config_set() writes to in a single function call. It does not globally change which configuration file is used in subsequent function calls. The default file path of the YAML file is always _targets.yaml unless you set another default path using the TAR_CONFIG environment variable, e.g. Sys.setenv(TAR_CONFIG = "custom.yaml"). This also has the effect of temporarily modifying the default arguments to other functions such as tar_make() because the default arguments to those functions are controlled by tar_config_get().
project     Character of length 1, name of the current targets project. Thanks to the config R package, targets YAML configuration files can store multiple sets
of configuration settings, with each set corresponding to its own project. The
project argument allows you to set or get a configuration setting for a spe-
cific project for a given call to tar_config_set() or tar_config_get(). The
default project is always called "main" unless you set another default project
using the TAR_PROJECT environment variable, e.g. Sys.setenv(tar_project = "custom"). This also has the effect of temporarily modifying the default argu-
ments to other functions such as tar_make() because the default arguments
to those functions are controlled by tar_config_get().

height  Character of length 1, height of the visNetwork widget and branches table.
display Character of length 1, which display to show first.
displays Character vector of choices for the display. Elements can be any of "graph",
             "summary", "branches", or "about".
background Logical, whether to run the app in a background process so you can still use the
             R console while the app is running.
browse Whether to open the app in a browser when the app is ready. Only relevant if
        background is TRUE.
host   Character of length 1, IPv4 address to listen on. Only relevant if background is
        TRUE.
port   Positive integer of length 1, TCP port to listen on. Only relevant if background
        is TRUE.
verbose whether to print a spinner and informative messages. Only relevant if background
        is TRUE.
supervise Whether to register the process with a supervisor. If TRUE, the supervisor will
             ensure that the process is killed when the R process exits.
poll_connection Whether to have a control connection to the process. This is used to transmit
             messages from the subprocess to the main process.
stdout The name of the file the standard output of the child R process will be written
to. If the child process runs with the --slave option (the default), then the com-
mands are not echoed and will not be shown in the standard output. Also note
that you need to call print() explicitly to show the output of the command(s).
IF NULL (the default), then standard output is not returned, but it is recorded and
included in the error object if an error happens.
stderr The name of the file the standard error of the child R process will be written to.
        In particular message() sends output to the standard error. If nothing was sent
to the standard error, then this file will be empty. This argument can be the same
        file as stdout, in which case they will be correctly interleaved. If this is the
        string "$2>&1", then standard error is redirected to standard output. IF NULL (the
default), then standard output is not returned, but it is recorded and included in
the error object if an error happens.

Details

The controls of the app are in the left panel. The seconds control is the number of seconds between
refreshes of the graph, and the other settings match the arguments of tar_visnetwork().
Value

A handle to call `r::r_bg()` background process running the app.

See Also

Examples

```r
if (identical(Sys.getenv("TAR_INTERACTIVE_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    tar_script({
      sleep_run <- function(...) {
        Sys.sleep(10)
      }
    },
    list(
      tar_target(settings, sleep_run()),
      tar_target(data1, sleep_run(settings)),
      tar_target(data2, sleep_run(settings))
    ),
    ask = FALSE)
  # Launch the app in a background process.
  tar_watch(seconds = 10, outdated = FALSE, targets_only = TRUE)
  # Run the pipeline.
  tar_make()
}
```

---

tar_watch_server

Shiny module server for `tar_watch()`

Description

Use `tar_watch_ui()` and `tar_watch_server()` to include `tar_watch()` as a Shiny module in an app.

Usage

```r
tar_watch_server(
  id,
  height = "650px",
  exclude = ".Random.seed",
  config = Sys.getenv("TAR_CONFIG", ".targets.yaml"),
  project = Sys.getenv("TAR_PROJECT", "main")
)
```
**tar_watch_ui**

**Arguments**

- **id** Character of length 1, ID corresponding to the UI function of the module.
- **height** Character of length 1, height of the visNetwork widget and branches table.
- **exclude** Character vector of nodes to omit from the graph.
- **config** Character of length 1, file path of the YAML configuration file with targets project settings. The **config** argument specifies which YAML configuration file that `tar_config_get()` reads from or `tar_config_set()` writes to in a single function call. It does not globally change which configuration file is used in subsequent function calls. The default file path of the YAML file is always _targets.yaml_ unless you set another default path using the TAR_CONFIG environment variable, e.g. `Sys.setenv(TAR_CONFIG = "custom.yaml")`. This also has the effect of temporarily modifying the default arguments to other functions such as `tar_make()` because the default arguments to those functions are controlled by `tar_config_get()`.
- **project** Character of length 1, name of the current targets project. Thanks to the **config** R package, targets YAML configuration files can store multiple sets of configuration settings, with each set corresponding to its own project. The **project** argument allows you to set or get a configuration setting for a specific project for a given call to `tar_config_set()` or `tar_config_get()`. The default project is always called "main" unless you set another default project using the TAR_PROJECT environment variable, e.g. `Sys.setenv(tar_project = "custom")`. This also has the effect of temporarily modifying the default arguments to other functions such as `tar_make()` because the default arguments to those functions are controlled by `tar_config_get()`.

**Value**

A Shiny module server.

**See Also**

Other progress: `tar_canceled()`, `tar_completed()`, `tar_dispatched()`, `tar_errrored()`, `tar_poll()`, `tar_progress()`, `tar_progress_branches()`, `tar_progress_summary()`, `tar_skipped()`, `tar_watch()`, `tar_watch_ui()`

---

**tar_watch_ui**

*Shiny module UI for tar_watch()

**Description**

Use `tar_watch_ui()` and `tar_watch_server()` to include `tar_watch()` as a Shiny module in an app.
Usage

```
tar_watch_ui(
  id,
  label = "tar_watch_label",
  seconds = 10,
  seconds_min = 1,
  seconds_max = 60,
  seconds_step = 1,
  targets_only = FALSE,
  outdated = FALSE,
  label_tar_visnetwork = NULL,
  level_separation = 150,
  degree_from = 1L,
  degree_to = 1L,
  height = "650px",
  display = "summary",
  displays = c("summary", "branches", "progress", "graph", "about")
)
```

Arguments

- **id**: Character of length 1, ID corresponding to the UI function of the module.
- **label**: Label for the module.
- **seconds**: Numeric of length 1, default number of seconds between refreshes of the graph. Can be changed in the app controls.
- **seconds_min**: Numeric of length 1, lower bound of `seconds` in the app controls.
- **seconds_max**: Numeric of length 1, upper bound of `seconds` in the app controls.
- **seconds_step**: Numeric of length 1, step size of `seconds` in the app controls.
- **targets_only**: Logical, whether to restrict the output to just targets (FALSE) or to also include global functions and objects.
- **outdated**: Logical, whether to show colors to distinguish outdated targets from up-to-date targets. (Global functions and objects still show these colors.) Looking for outdated targets takes a lot of time for large pipelines with lots of branches, and setting outdated to FALSE is a nice way to speed up the graph if you only want to see dependency relationships and pipeline progress.
- **label_tar_visnetwork**: Character vector, label argument to `tar_visnetwork()`.
- **level_separation**: Numeric of length 1, `levelSeparation` argument of `visNetwork::visHierarchicalLayout()`. Controls the distance between hierarchical levels. Consider changing the value if the aspect ratio of the graph is far from 1. If `level_separation` is NULL, the `levelSeparation` argument of `visHierarchicalLayout()` defaults to 150.
- **degree_from**: Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. `degree_from` controls the number of edges the neighborhood extends upstream.
degree_to Integer of length 1. When you click on a node, the graph highlights a neighborhood of that node. degree_to controls the number of edges the neighborhood extends downstream.

height Character of length 1, height of the visNetwork widget and branches table.
display Character of length 1, which display to show first.
displays Character vector of choices for the display. Elements can be any of "graph", "summary", "branches", or "about".

Value

A Shiny module UI.

tar_workspace Load a saved workspace and seed for debugging.

Description

Load the packages, workspace, and random number generator seed of target attempted with a workspace file.

Usage

tar_workspace(
  name,
  envir = parent.frame(),
  packages = TRUE,
  source = TRUE,
  script = targets::tar_config_get("script"),
  store = targets::tar_config_get("store")
)

Arguments

name Symbol, name of the target whose workspace to read.
envir Environment in which to put the objects.
packages Logical, whether to load the required packages of the target.
source Logical, whether to run _targets.R to load user-defined global object dependencies into envir. If TRUE, then envir should either be the global environment or inherit from the global environment.
`tar_workspace`  

Character of length 1, path to the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`. When you set this argument, the value of `tar_config_get("script")` is temporarily changed for the current function call. See `tar_script()`, `tar_config_get()`, and `tar_config_set()` for details about the target script file and how to set it persistently for a project.

Character of length 1, path to the targets data store. Defaults to `tar_config_get("store")`, which in turn defaults to `_targets/`. When you set this argument, the value of `tar_config_get("store")` is temporarily changed for the current function call. See `tar_config_get()` and `tar_config_set()` for details about how to set the data store path persistently for a project.

Details

If you activate workspaces through the workspaces argument of `tar_option_set()`, then under the circumstances you specify, targets will save a special workspace file to a location in in `_targets/workspaces/`. The workspace file is a compact reference that allows `tar_workspace()` to load the target’s dependencies and random number generator seed as long as the data objects are still in the data store (usually files in `_targets/objects/`). When you are done debugging, you can remove the workspace files using `tar_destroy(destroy = "workspaces")`.

Value

This function returns `NULL`, but it does load the target’s required packages, as well as multiple objects into the environment (`envir` argument) in order to replicate the workspace where the error happened. These objects include the global objects at the time `tar_make()` was called and the dependency targets. The random number generator seed for the target is also assigned with `tar_seed_set()`.

See Also

Other debug: `tar_loadGlobals()`, `tar_traceback()`, `tar_workspaces()`

Examples

```r
if (identical(Sys.getenv("TAR_EXAMPLES"), "true")) { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tmp <- sample(1)
tar_script(
  tar_option_set(workspace_on_error = TRUE)
  list(
    tar_target(x, "loaded"),
    tar_target(y, stop(x))
  )
}, ask = FALSE)
# The following code throws an error for demonstration purposes.
try(tar_make())
extists("x") # Should be FALSE.
tail(.Random.seed) # for comparison to the RNG state after tar_workspace(y)
tar_workspace(y)
extists("x") # Should be TRUE.
```
print(x) # "loaded"
# Should be different: tar_workspace() runs
tar_seed_set(tar_meta(y, seed)$seed)
tail(.Random.seed)
})
}

tar_workspaces

List saved target workspaces.

Description
List target workspaces currently saved to _targets/workspaces/. See tar_workspace() for more information.

Usage
tar_workspaces(names = NULL, store = targets::tar_config_get("store"))

Arguments
names Optional tidyselect selector to return a tactical subset of workspace names. If NULL, all names are selected.
store Character of length 1, path to the targets data store. Defaults to tar_config_get("store"), which in turn defaults to _targets/. When you set this argument, the value of tar_config_get("store") is temporarily changed for the current function call. See tar_config_get() and tar_config_set() for details about how to set the data store path persistently for a project.

Value
Character vector of available workspaces to load with tar_workspace().

See Also
Other debug: tar_loadGlobals(), tar_traceback(), tar_workspace()

Examples
if (identical(Sys.getenv("TAR_EXAMPLES"), "true") { # for CRAN
tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
tar_script(
  tar_option_set(workspace_on_error = TRUE)
  list(
    tar_target(x, "value"),
    tar_target(y, x)
  )
), ask = FALSE)
tar_make()
use_targets

```r
tar_workspaces()
tar_workspaces(contains("x"))
}
```

---

**use_targets**  
*Use targets*

---

**Description**

Set up targets for an existing project.

**Usage**

```r
use_targets(
  script = targets::tar_config_get("script"),
  open = interactive(),
  overwrite = FALSE,
  scheduler = NULL,
  job_name = NULL
)
```

**Arguments**

- **script** Character of length 1, where to write the target script file. Defaults to `tar_config_get("script")`, which in turn defaults to `_targets.R`.
- **open** Logical of length 1, whether to open the file for editing in the RStudio IDE.
- **overwrite** Logical of length 1, `TRUE` to overwrite the the target script file, `FALSE` otherwise.
- **scheduler** Deprecated in version 1.5.0.9001 (2024-02-12).
- **job_name** Deprecated in version 1.5.0.9001 (2024-02-12).

**Details**

`use_targets()` writes an example `_targets.R` script to get started with a `targets` pipeline for the current project. Follow the comments in this script to adapt it as needed. For more information, please visit [https://books.ropensci.org/targets/walkthrough.html](https://books.ropensci.org/targets/walkthrough.html).

**Value**

`NULL` (invisibly).

**See Also**

Other help: `tar_reprex()`, `targets-package`, `use_targets_rmd()`
Examples

```r
if (identical(Sys.getenv("TAR_INTERACTIVE_EXAMPLES"), "true")) {
  tar_dir({ # tar_dir() runs code from a temp dir for CRAN.
    use_targets(open = FALSE)
  })
}
```

use_targets_rmd  

Use targets with Target Markdown.

Description

Create an example Target Markdown report to get started with targets.

Usage

```r
use_targets_rmd(path = "_targets.Rmd", open = interactive())
```

Arguments

- `path`  
  Character of length 1, output path of the Target Markdown report relative to the current active project.

- `open`  
  Logical, whether to open the file for editing in the RStudio IDE.

Value

NULL (invisibly).
