Package ‘tkrplot’

October 5, 2021

Version 0.0-26
Author Luke Tierney <luke-tierney@uiowa.edu>
Description Simple mechanism for placing R graphics in a Tk widget.
Title TK Rplot
Depends R (>= 2.13), grDevices, tcltk
License GPL
Maintainer Luke Tierney <luke-tierney@uiowa.edu>
SystemRequirements Windows or X11
NeedsCompilation yes
Repository CRAN
Date/Publication 2021-10-05 16:40:02 UTC

Description

Placing R graphics in a Tk image.

Usage

tkrplot(parent, fun, hscale=1, vscale=1)
tkrreplot(lab, fun = lab$fun, hscale=lab$hscale, vscale=lab$vscale)
tkpersp(x,y,z, theta = 30,phi = 30,expand = 0.5, r = sqrt(3), ...)

1
Arguments

parent  parent of widget window
fun     function of no arguments that creates the plot
lab     a Tk Rplot label widget
hscale  horizontal scale factor for image size
vscale  vertical scale factor for image size
x       as for `persp`
y       as for `persp`
z       as for `persp`
theta   as for `persp`
phi     as for `persp`
expand  as for `persp`
r       as for `persp`
...     additional arguments for `persp`

Details

The function `tkrplot` creates and returns a Tk label widget containing a Tk image of type Rplot. For now the size is hard-wired. The plot is created by calling `fun` with a special device used to create the image.

The function `tkrreplot` calls `fun` to place a new plot in the Rplot widget `lab`.

`tkpersp` is called like `persp` but produces a plot in which some of the parameters of `persp` are controlled graphically.

Examples

```r
## Not run:
## These cannot be run by examples() but should be OK when pasted into an interactive R session with the tcltk package loaded

tt <- tktoplevel()
bb<1
img <- tkrplot(tt, function() plot(1:20,(1:20)^bb))
f<-function(...) {
  b <- as.numeric(tclvalue("bb"))
  if (b != bb) {
    bb <<- b
    tkrreplot(img)
  }
}
s <- tkscale(tt, command=f, from=0.05, to=2.00, variable="bb", showvalue=FALSE, resolution=0.05, orient="horiz")
tkpack(img,s)

## End(Not run)
```
