Package ‘tsne’
March 28, 2022

Type Package
Title T-Distributed Stochastic Neighbor Embedding for R (t-SNE)
Version 0.1-3.1
Date 2016-06-04
Author Justin Donaldson <jdonaldson@gmail.com>
Maintainer Justin Donaldson <jdonaldson@gmail.com>
Description A ``pure R'' implementation of the t-SNE algorithm.
License GPL
LazyLoad yes
NeedsCompilation no

| The tsne-package for multidimensional scaling |

Description

This package contains one function called tsne which contains all the functionality.

Details
Author(s)

References

tsne

The t-SNE method for dimensionality reduction

Description

Provides a simple function interface for specifying t-SNE dimensionality reduction on R matrices or "dist" objects.

Usage

```r
tsne(X, initial_config = NULL, k = 2, initial_dims = 30, perplexity = 30, max_iter = 1000, min_cost = 0, epoch_callback = NULL, whiten = TRUE, epoch=100)
```

Arguments

- **X**: The R matrix or "dist" object
- **initial_config**: an argument providing a matrix specifying the initial embedding for X. See Details.
- **k**: the dimension of the resulting embedding.
- **initial_dims**: The number of dimensions to use in reduction method.
- **perplexity**: Perplexity parameter. (optimal number of neighbors)
- **max_iter**: Maximum number of iterations to perform.
min_cost
epoch_callback
whiten
epoch

The minimum cost value (error) to halt iteration.
A callback function used after each epoch (an epoch here means a set number of iterations)
A boolean value indicating whether the matrix data should be whitened.
The number of iterations in between update messages.

Details
When the initial_config argument is specified, the algorithm will automatically enter the final momentum stage. This stage has less large scale adjustment to the embedding, and is intended for small scale tweaking of positioning. This can greatly speed up the generation of embeddings for various similar X datasets, while also preserving overall embedding orientation.

Value
An R object containing a ydata embedding matrix, as well as a the matrix of probabilities P

Examples
```r
## Not run:
colors = rainbow(length(unique(iris$Species)))
names(colors) = unique(iris$Species)
ecb = function(x,y){ plot(x,t='n'); text(x,labels=iris$Species, col=colors[iris$Species]) }
tsne_iris = tsne(iris[,1:4], epoch_callback = ecb, perplexity=50)

# compare to PCA
dev.new()
pca_iris = princomp(iris[,1:4])$scores[,1:2]
plot(pca_iris, t='n')
text(pca_iris, labels=iris$Species, col=colors[iris$Species])

## End(Not run)
```
