Package ‘voteogram’

October 12, 2022

Type Package

Title United States House and Senate Voting Cartogram Generators

Version 0.3.1

Date 2018-09-16

Maintainer Bob Rudis <bob@rud.is>

Description 'ProPublica' \(<https://projects.propublica.org/represent/\>) makes United States Congress member votes available and has developed their own unique cartogram to visually represent this data. Tools are provided to retrieve voting data, prepare voting data for plotting with 'ggplot2', create vote cartograms and theme them.

Author Bob Rudis [aut, cre] (<https://orcid.org/0000-0001-5670-2640>), ProPublica [cph] (Cartogram SVGs used to make the plot data.frames), GovTrack [cph] (Cartogram SVG used to make the plot data.frame)

Repository CRAN

Date/Publication 2018-09-16 21:30:03 UTC

R topics documented:

  - fortify.pprc .................................................. 2
  - house_carto .................................................... 2
### `fortify.pprc`

*Fortify a `roll_call()` (pprc) object*

**Description**

Fortify a `roll_call()` (pprc) object

**Usage**

```r
## S3 method for class 'pprc'
fortify(model, data)
```

**Arguments**

- `model`: a `roll_call()` (pprc) object
- `data`: unused

### `house_carto`

*Produce a ProPublica- or GovTrack-style House roll call vote cartogram*

**Description**

Produce a ProPublica- or GovTrack-style House roll call vote cartogram

**Usage**

```r
house_carto(vote_tally, style = c("pp", "gt", "propublica", "govtrack"),
            pp_square = FALSE)
```
Arguments

vote_tally: either a pprc object (the result of a call to `roll_call()`) or a data.frame of vote tallies for the house. It expects 3 columns: state_abbrev: the 2-letter U.S. state abbreviation; district: either 1 or 2 to distinguish between each representative; party: R, D or ID; position: yes, no, present, none for how the representative voted.

style: either ProPublica-ish (pp or propublica) or GovTrack-ish (gt or govtrack)

pp_square: if TRUE then no "state borders" will be drawn, but distinct Representative squares. If FALSE then the cartogram will be very close to the ProPublica cartograms.

Value

a ggplot2 object that you can further customize with scales, labels, etc.

Note

No "themeing" is applied to the returned ggplot2 object. You can use `theme_voteogram()` if you need a base theme. Also, GovTrack-style cartograms will have `coord_equal()` applied by default.

Examples

```r
## Not run:
# what you'd normally do
rep <- roll_call("house", 115, 1, 256)

## End(Not run)

# using a saved object
rep <- readRDS(system.file("extdata", "rep.rds", package="voteogram"))

house_carto(rep, pp_square=TRUE)
```

print.pprc

Better default print function for `roll_call()` (pprc) objects

Description

Better default print function for `roll_call()` (pprc) objects

Usage

```r
## S3 method for class 'pprc'
print(x, ...)
```

Arguments

x: a `roll_call()` (pprc) object

...: ignored
roll_call

Get Voting Record for House or Senate By Number, Session & Roll Call Number

Description

Get Voting Record for House or Senate By Number, Session & Roll Call Number

Usage

roll_call(critter = c("house", "senate"), number, session = c(1L, 2L), rcall)

Arguments

critter one of ‘house’ or ‘senate’
number valid congress number. ProPublica seems to have data going back to the 101st Congress, so valid values are ‘101’-present Congress number (‘115’ as of the creation date of the package).
session a valid session number (i.e. ‘1’ or ‘2’ and valid for current year)
rcall roll call vote number

Value

a ‘list’, one component of which is a ‘votes’ ‘data.frame’

Note

Try to cache this data if at all possible. ProPublica is a non-profit organization and this data comes from their Amazon S3 buckets. Every access in a given month ticks down the "free" counter.

Examples

```
## Not run:
# these make API calls so they aren't run in the examples
rep <- roll_call("house", 115, 1, 256)
sen <- roll_call("senate", 115, 1, 110)

## End(Not run)
```
Description

Produce a Senate cartogram

Usage

senate_carto(vote_tally)

Arguments

vote_tally either a pprc object (the result of a call to roll_call()) or a data.frame of vote tallies for the senate. It expects 3 columns. state_abbrev: the 2-letter U.S. state abbreviation; district: either 1 or 2 to distinguish between each senator; party: R, D or ID; position: yes, no, present, none for how the senator voted.

Value

a ggplot2 object that you can further customize with scales, labels, etc.

Note

No "themeing" is applied to the returned ggplot2 object. You can use theme_voteogram() if you need a base theme.

Examples

## Not run:
# what you'd normally do
sen <- roll_call("senate", 115, 1, 110)

## End(Not run)

# Using a saved object
sen <- readRDS(system.file("extdata", "sen.rds", package="voteogram"))

senate_carto(sen)
Description

Provides a very basic theme with no background, grid, axis text or axis ticks and an easy way to turn the legend on or off.

Usage

theme.voteogram(legend = TRUE)

Arguments

legend if ‘FALSE’ no legend is shown

Examples

## Not run:
# what you'd normally do
sen <- roll_call("senate", 115, 1, 110)

## End(Not run)

# using a saved object
sen <- readRDS(system.file("extdata", "sen.rds", package="voteogram"))

senate_carto(sen) +
  theme_voteogram()

Description

ProPublica’ <https://projects.propublica.org/represent/> makes United States Congress member votes available and has developed their own unique cartogram to visually represent this data. Tools are provided to retrieve voting data, prepare voting data for plotting with ‘ggplot2’, create vote cartograms and theme them.

Author(s)

Bob Rudis (bob@rud.is)
Description
Manual color scales fill and color scale values (in the event you need to use them) outside the main plotting functions.

Usage
vote_carto_fill
vote_carto_color

Format
An object of class character of length 13.

Description
The following functions are imported and then re-exported from the voteogram package to enable use of the magrittr pipe operator with no additional library calls.
