Package ‘wk’

July 9, 2024

Title  Lightweight Well-Known Geometry Parsing
Version  0.9.2
Maintainer  Dewey Dunnington <dewey@fishandwhistle.net>
Description  Provides a minimal R and C++ API for parsing
well-known binary and well-known text representation of
geometries to and from R-native formats.
Well-known binary is compact
and fast to parse; well-known text is human-readable
and is useful for writing tests. These formats are
useful in R only if the information they contain can be
accessed in R, for which high-performance functions
are provided here.
License  MIT + file LICENSE
Encoding  UTF-8
RoxygenNote  7.2.3
Suggests  testthat (>= 3.0.0), vctrs (>= 0.3.0), sf, tibble, readr

Description

2D Circle Vectors

Usage

crc(x = double(), y = double(), r = double(), crs = wk_crs_auto())

as_crc(x, ...)

## S3 method for class 'wk_crc'
as_crc(x, ...)

## S3 method for class 'matrix'
as_crc(x, ..., crs = NULL)

## S3 method for class 'data.frame'
as_crc(x, ..., crs = NULL)

Arguments

x, y Coordinates of the center
r Circle radius
crs A value to be propagated as the CRS for this vector.
... Extra arguments passed to as_crc().

Value

A vector along the recycled length of bounds.
Examples

crc(1, 2, 3)

crc_x(x)
crc_y(x)
crc_center(x)
crc_r(x)

Arguments

x A crc() vector

Value

Components of the crc() vector

Examples

x <- crc(1, 2, r = 3)
crc_x(x)
crc_y(x)
crc_center(x)
grd objects are just an array (any object with more than two \texttt{dim()}s) and a bounding box (a \texttt{rct()}, which may or may not have a \texttt{wk_crs()} attached). The ordering of the dimensions is \texttt{y} (indices increasing downwards), \texttt{x} (indices increasing to the right). This follows the ordering of \texttt{as.raster()}%/rasterImage()% and aligns with the printing of matrices.

Usage

\begin{verbatim}
grd(
    bbox = NULL,
    nx = NULL,
    ny = NULL,
    dx = NULL,
    dy = NULL,
    type = c("polygons", "corners", "centers")
)
grd_rct(data, bbox = rct(0, 0, dim(data)[2], dim(data)[1]))
grd_xy(data, bbox = rct(0, 0, dim(data)[2] - 1, dim(data)[1] - 1))
as_grd_rct(x, ...)
## S3 method for class 'wk_grd_rct'
as_grd_rct(x, ...)
## S3 method for class 'wk_grd_xy'
as_grd_rct(x, ...)
as_grd_xy(x, ...)
## S3 method for class 'wk_grd_xy'
as_grd_xy(x, ...)
## S3 method for class 'wk_grd_rct'
as_grd_xy(x, ...)
\end{verbatim}

Arguments

\begin{itemize}
  \item \texttt{bbox} \hspace{1cm} A \texttt{rct()} containing the bounds and CRS of the object. You can specify a \texttt{rct()} with \texttt{xmin > xmax} or \texttt{ymin > ymax} which will flip the underlying data and return an object with a normalized bounding box and data.
\end{itemize}
nx, ny, dx, dy Either a number of cells in the x- and y- directions or delta in the x- and y-
directions (in which case bbox must be specified).

type Use "polygons" to return a grid whose objects can be represented using an
rct(); use "centers" to return a grid whose objects are the center of the rct() grid; use "corners" to return a grid along the corners of bbox.

data An object with two or more dimensions. Most usefully, a matrix.

x An object to convert to a grid

... Passed to S3 methods

Value

• grd() returns a grd_rct() for type == "polygons or a grd_xy() otherwise.
• grd_rct() returns an object of class "wk_grd_rct".
• grd_xy() returns an object of class "wk_grd_xy".

Examples

# create a grid with no data (just for coordinates)
(grid <- grd(nx = 2, ny = 2))
as_rct(grid)
as_xy(grid)
plot(grid, border = "black")

# more usefully, wraps a matrix or nd array + bbox
# approx volcano in New Zealand Transverse Mercator
bbox <- rct(
  5917000, 1757000 + 870,
  5917000 + 610, 1757000,
  crs = "EPSG:2193"
)
(grid <- grd_rct(volcano, bbox))

# these come with a reasonable default plot method for matrix data
plot(grid)

# you can set the data or the bounding box after creation
grid$bbox <- rct(0, 0, 1, 1)

# subset by indices or rct
plot(grid[1:2, 1:2])
plot(grid[c(start = NA, stop = NA, step = 2), c(start = NA, stop = NA, step = 2)])
plot(grid[rct(0, 0, 0.5, 0.5)])
Description

Grid cell operators

Usage

grd_cell(grid, point, ..., snap = grd_snap_next)

grd_cell_range(
  grid,
  bbox = wk_bbox(grid),
  ...,
  step = 1L,
  snap = grd_snap_next
)

grd_cell_rct(grid, i, j = NULL, ...)

## S3 method for class 'wk_grd_rct'
grd_cell_rct(grid, i, j = NULL, ..., out_of_bounds = "keep")

## S3 method for class 'wk_grd_xy'
grd_cell_rct(grid, i, j = NULL, ..., out_of_bounds = "keep")

grd_cell_xy(grid, i, j = NULL, ...)

## S3 method for class 'wk_grd_rct'
grd_cell_xy(grid, i, j = NULL, ..., out_of_bounds = "keep")

## S3 method for class 'wk_grd_xy'
grd_cell_xy(grid, i, j = NULL, ..., out_of_bounds = "keep")

Arguments

grid A `grd_xy()`, `grd_rct()`, or other object implementing `grd_*()` methods.
point A handleable of points.
... Unused
snap A function that transforms real-valued indices to integer indices (e.g., `floor()`, `ceiling()`, or `round()`). For `grd_cell_range()`, a list() with exactly two elements to be called for the minimum and maximum index values, respectively.
bbox An `rct()` object.
step The difference between adjacent indices in the output
i, j 1-based index values. i indices correspond to decreasing y values; j indices correspond to increasing x values. Values outside the range 1:nrow|ncol(data) will be censored to NA including 0 and negative values.

out_of_bounds One of 'keep', 'censor', 'discard', or 'squish'

Value

- `grd_cell()`: returns a list(i, j) of index values corresponding to the input points and adjusted according to snap. Index values will be outside `dim(grid)` for points outside `wk_bbox(grid)` including negative values.
- `grd_cell_range()` returns a slice describing the range of indices in the i and j directions.
- `grd_cell_rct()` returns a rct() of the cell extent at i, j.
- `grd_cell_xy()` returns a xy() of the cell center at i, j.

Examples

```r
grid <- grd(nx = 3, ny = 2)
grd_cell(grid, xy(0.5, 0.5))
grd_cell_range(grid, grid$bbox)
grd_cell_rct(grid, 1, 1)
grd_cell_xy(grid, 1, 1)
```

---

### grd_extract

**Extract values from a grid**

**Description**

Unlike `grd_subset()`, which subsets like a matrix, `grd_extract()` returns values.

**Usage**

```r
grd_extract(grid, i = NULL, j = NULL)

grd_extract_nearest(grid, point, out_of_bounds = c("censor", "squish"))

grd_data_extract(grid_data, i = NULL, j = NULL)
```

**Arguments**

- `grid` A `grd_xy()`, `grd_rct()`, or other object implementing `grd_*()` methods.
- `i, j` Index values as in `grd_subset()` except recycled to a common size.
- `point` A handleable of points.
- `out_of_bounds` One of `keep`, `censor`, `discard`, or `squish`
- `grid_data` The data member of a `grd()`. This is typically an array but can also be an S3 object with an array-like subset method. The `native raster` is special-cased as its subset method requires non-standard handling.
**Value**

A matrix or vector with two fewer dimensions than the input.

---

**grd_snap_next**

*Index snap functions*

**Description**

These functions can be used in `grd_cell()` and `grd_cell_range()`. These functions differ in the way they round 0.5: `grd_snap_next()` always rounds up and `grd_snap_previous()` always rounds down. You can also use `floor()` and `ceiling()` as index snap functions.

**Usage**

```
grd_snap_next(x)
```

```
grd_snap_previous(x)
```

**Arguments**

- `x`  
  A vector of rescaled but non-integer indices

**Value**

A vector of integer indices

**Examples**

```
grd_snap_next(seq(0, 2, 0.25))
grd_snap_previous(seq(0, 2, 0.25))
```

---

**grd_subset**

*Subset grid objects*

**Description**

The `grd_subset()` method handles the subsetting of a `grd()` in x-y space. Ordering of indices is not considered and logical indices are recycled silently along dimensions. The result of a `grd_subset()` is always a `grd()` of the same type whose relationship to x-y space has not changed.
Usage

```r
grid_subset(grid, i = NULL, j = NULL, ...)
grd_crop(grid, bbox, ..., step = 1L, snap = NULL)
grd_extend(grid, bbox, ..., step = 1L, snap = NULL)
```  
## S3 method for class 'wk_grd_rct'
```r
grd_crop(grid, bbox, ..., step = 1L, snap = NULL)
```  
## S3 method for class 'wk_grd_xy'
```r
grd_crop(grid, bbox, ..., step = 1L, snap = NULL)
```  
## S3 method for class 'wk_grd_rct'
```r
grd_extend(grid, bbox, ..., step = 1L, snap = NULL)
```  
## S3 method for class 'wk_grd_xy'
```r
grd_extend(grid, bbox, ..., step = 1L, snap = NULL)
```  
```r
grd_data_subset(grid_data, i = NULL, j = NULL)
```  
Arguments

- **grid**: A `grd_xy()`, `grd_rct()`, or other object implementing `grd_*()` methods.
- **i, j**: 1-based index values. i indices correspond to decreasing y values; j indices correspond to increasing x values. Values outside the range `1:nrow|ncol(data)` will be censored to NA including 0 and negative values.
- **...**: Passed to subset methods
- **bbox**: An `rct()` object.
- **step**: The difference between adjacent indices in the output
- **snap**: A function that transforms real-valued indices to integer indices (e.g., `floor()`, `ceiling()`, or `round()`). For `grd_cell_range()`, a list() with exactly two elements to be called for the minimum and maximum index values, respectively.
- **grid_data**: The data member of a `grd()`. This is typically an array but can also be an S3 object with an array-like subset method. The native raster is special-cased as its subset method requires non-standard handling.

Value

A modified grid whose cell centres have not changed location as a result of the subset.

Examples

```r
grid <- grd_rct(volcano)
grd_subset(grid, 1:20, 1:30)
grd_crop(grid, rct(-10, -10, 10, 10))
grd_extend(grid, rct(-10, -10, 10, 10))
```
**grd_summary**

---

**Grid information**

**Description**

Grid information

**Usage**

```r
grd_summary(grid)
```

**Arguments**

grid  
A `grd_xy()`, `grd_rct()`, or other object implementing `grd_*()` methods.

**Value**

- `grd_summary()` returns a list() with components `xmin`, `ymin`, `xmax`, `ymax`, `nx`, `ny`, `dx`, `dy`, `width`, and `height`.

**Examples**

```r
grd_summary(grd(nx = 3, ny = 2))
```

---

**grd_tile**

---

**Extract normalized grid tiles**

**Description**

Unlike `grd_tile_template()`, which returns a `grd()` whose elements are the boundaries of the specified tiles with no data attached, `grd_tile()` returns the actual tile with the data.

**Usage**

```r
grd_tile(grid, level, i, j = NULL)
```

## S3 method for class 'wk_grd_rct'
```r
grd_tile(grid, level, i, j = NULL)
```

## S3 method for class 'wk_grd_xy'
```r
grd_tile(grid, level, i, j = NULL)
```
Arguments

grid  A `grd_xy()`, `grd_rct()`, or other object implementing `grd_*()` methods.
level  An integer describing the overview level. This is related to the step value by a power of 2 (i.e., a level of 1 indicates a step of 2, a level of 2 indicates a step of 4, etc.).
i, j  1-based index values. i indices correspond to decreasing y values; j indices correspond to increasing x values. Values outside the range 1:nrow|ncol(data) will be censored to NA including 0 and negative values.

Value

A `grd_subset()`ed version

Examples

```r
grid <- grd_rct(volcano)
plot(grd_tile(grid, 4, 1, 1))

plot(grd_tile(grid, 3, 1, 1), add = TRUE)
plot(grd_tile(grid, 3, 1, 2), add = TRUE)
plot(grd_tile(grid, 3, 2, 1), add = TRUE)
plot(grd_tile(grid, 3, 2, 2), add = TRUE)

grid <- as_grd_xy(grd_tile(grid, 4, 1, 1))
plot(grid, add = TRUE, pch = ".")
plot(grd_tile(grid, 3, 1, 1), add = TRUE, col = "green", pch = ".")
plot(grd_tile(grid, 3, 1, 2), add = TRUE, col = "red", pch = ".")
plot(grd_tile(grid, 3, 2, 1), add = TRUE, col = "blue", pch = ".")
plot(grd_tile(grid, 3, 2, 2), add = TRUE, col = "magenta", pch = ".")
```

`grd_tile_template` **Compute overview grid tile**

Description

A useful workflow for raster data in a memory bounded environment is to chunk a grid into sections or tiles. These functions compute tiles suitable for such processing. Use `grd_tile_summary()` to generate statistics for level values to choose for your application.

Usage

```r
grd_tile_template(grid, level)

grd_tile_summary(grid, levels = NULL)
```
Arguments

grid  A `grd_xy()`, `grd_rct()`, or other object implementing `grd_*()` methods.
level An integer describing the overview level. This is related to the step value by a
power of 2 (i.e., a level of 1 indicates a step of 2, a level of 2 indicates a step of
4, etc.).
levels A vector of level values or NULL to use a sequence from 0 to the level that
would result in a 1 x 1 grid.

Value

A `grd()`

Examples

```r
grid <- grd_rct(volcano)
grd_tile_summary(grid)
grd_tile_template(grid, 3)
```

*handle_wkt_without_vector_size*

Test handlers for handling of unknown size vectors

Description

Test handlers for handling of unknown size vectors

Usage

```r
handle_wkt_without_vector_size(handleable, handler)
```

Arguments

handleable  A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for
which `wk_handle()` is defined.
handler    A `wk_handler` object.

Examples

```r
handle_wkt_without_vector_size(wkt(), wk_vector_meta_handler())
```
new_wk_crc  
S3 details for crc objects

Description

S3 details for crc objects

Usage

new_wk_crc(x = list(x = double(), y = double(), r = double()), crs = NULL)

Arguments

x  
A crc()

crs  
A value to be propagated as the CRS for this vector.

new_wk_grd  
S3 details for grid objects

Description

S3 details for grid objects

Usage

new_wk_grd(x, subclass = character())

Arguments

x  
A grd()

subclass  
An optional subclass.

Value

An object inheriting from 'grd'
**new_wk_rct**

*S3 details for rct objects*

**Description**

S3 details for rct objects

**Usage**

```r
eew_wk_rct(
  x = list(xmin = double(), ymin = double(), xmax = double(), ymax = double()),
  crs = NULL
)
```

**Arguments**

- `x` A `rct()`
- `crs` A value to be propagated as the CRS for this vector.

**new_wk_wkb**

*S3 Details for wk_wkb*

**Description**

S3 Details for wk_wkb

**Usage**

```r
eew_wk_wkb(x = list(), crs = NULL, geodesic = NULL)

validate_wk_wkb(x)

is_wk_wkb(x)
```

**Arguments**

- `x` A (possibly) `wkb()` vector
- `crs` A value to be propagated as the CRS for this vector.
- `geodesic` TRUE if edges must be interpolated as geodesics when coordinates are spherical, FALSE otherwise.
new_wk_wkt

S3 Details for wk_wkt

Description
S3 Details for wk_wkt

Usage
new_wk_wkt(x = character(), crs = NULL, geodesic = NULL)

is_wk_wkt(x)

validate_wk_wkt(x)

Arguments

x A (possibly) wkt() vector

 CRS A value to be propagated as the CRS for this vector.

gerodesic TRUE if edges must be interpolated as geodesics when coordinates are spherical, FALSE otherwise.

new_wk_xy

S3 details for xy objects

Description
S3 details for xy objects

Usage
new_wk_xy(x = list(x = double(), y = double()), crs = NULL)

new_wk_xyz(x = list(x = double(), y = double(), z = double()), crs = NULL)

new_wk_xym(x = list(x = double(), y = double(), m = double()), crs = NULL)

new_wk_xyzm(x = list(x = double(), y = double(), z = double(), m = double()), crs = NULL)

validate_wk_xy(x)

validate_wk_xyz(x)
validate_wk_xym(x)

validate_wk_xyzm(x)

**Arguments**

- **x**: A *xy()* object.
- **crs**: A value to be propagated as the CRS for this vector.

---

**Description**

Plot grid objects

**Usage**

```r
## S3 method for class 'wk_grd_xy'
plot(x, ...)
```

```r
## S3 method for class 'wk_grd_rct'
plot(
  x,
  ..., 
  image = NULL,
  interpolate = FALSE,
  oversample = 4,
  border = NA,
  asp = 1,
  bbox = NULL,
  xlab = "",
  ylab = "",
  add = FALSE
)
```

**Arguments**

- **x**: A *wkb()* or *wkt()*
- **...**: Passed to plotting functions for features: *graphics::points()* for point and multipoint geometries, *graphics::lines()* for linestring and multilinestring geometries, and *graphics::polypath()* for polygon and multipolygon geometries.
- **image**: A raster or nativeRaster to pass to *graphics::rasterImage()*. Use NULL to do a quick-and-dirty rescale of the data such that the low value is black and the high value is white.
interpolate  Use TRUE to perform interpolation between color values.
oversample  A scale on the number of pixels on the device to use for sampling estimation of large raster values. Use Inf to disable.
border  Color to use for polygon borders. Use NULL for the default and NA to skip plotting borders.
asp, xlab, ylab  Passed to graphics::plot()
bbox  The limits of the plot as a rct() or compatible object
add  Should a new plot be created, or should handleable be added to the existing plot?

Value

x, invisibly.

Examples

plot(grd_rct(volcano))
plot(grd_xy(volcano))

---

rct  2D rectangle vectors

Description

2D rectangle vectors

Usage

rct(
  xmin = double(),
  ymin = double(),
  xmax = double(),
  ymax = double(),
  crs = wk_crs_auto()
)

as_rct(x, ...)

## S3 method for class 'wk_rct'
as_rct(x, ...)

## S3 method for class 'matrix'
as_rct(x, ..., crs = NULL)

## S3 method for class 'data.frame'
as_rct(x, ..., crs = NULL)
Arguments

- xmin, ymin, xmax, ymax
  - Rectangle bounds.
- crs
  - A value to be propagated as the CRS for this vector.
- x
  - An object to be converted to a `rct()`.
- ...
  - Extra arguments passed to `as_rct()`.

Value

A vector along the recycled length of bounds.

Examples

```r
rct(1, 2, 3, 4)
```

---

**Description**

Rectangle accessors and operators

**Usage**

```r
rct_xmin(x)
rct_ymin(x)
rct_xmax(x)
rct_ymax(x)
rct_width(x)
rct_height(x)
rct_intersects(x, y)
rct_contains(x, y)
rct_intersection(x, y)
```

**Arguments**

- x, y
  - `rct()` vectors
Value

- `rct_xmin()`, `rct_xmax()`, `rct_ymin()`, and `rct_ymax()` return the components of the `rct()`.

Examples

```r
x <- rct(0, 0, 10, 10)
y <- rct(5, 5, 15, 15)

rct_xmin(x)
rct_ymin(x)
rct_xmax(x)
rct_ymax(x)
rct_height(x)
rct_width(x)
rct_intersects(x, y)
rct_intersection(x, y)
rct_contains(x, y)
rct_contains(x, rct(4, 4, 6, 6))
```

---

### vctrs-methods

<table>

### Usage

- `vec_cast.wk_wkb(x, to, ...)`
- `vec_ptype2.wk_wkb(x, y, ...)`
- `vec_cast.wk_wkt(x, to, ...)`
- `vec_ptype2.wk_wkt(x, y, ...)`
- `vec_cast.wk_xy(x, to, ...)`
- `vec_ptype2.wk_xy(x, y, ...)`
- `vec_cast.wk_xyz(x, to, ...)`
- `vec_ptype2.wk_xyz(x, y, ...)`
- `vec_cast.wk_xym(x, to, ...)`
- `vec_ptype2.wk_xym(x, y, ...)`
vec_cast.wk_xyzm(x, to, ...)  
vec_ptype2.wk_xyzm(x, y, ...)  
vec_cast.wk_rct(x, to, ...)  
vec_ptype2.wk_rct(x, y, ...)  
vec_cast.wk_crc(x, to, ...)  
vec_ptype2.wk_crc(x, y, ...)

Arguments

x, y, to, ... See vctrs::vec_cast() and vctrs::vec_ptype2().

---

**wkb**

*Mark lists of raw vectors as well-known binary*

---

**Description**

Mark lists of raw vectors as well-known binary

**Usage**

```
wkb(x = list(), crs = wk_crs_auto(), geodesic = FALSE)
parse_wkb(x, crs = wk_crs_auto(), geodesic = FALSE)
wk_platform_endian()
```

```
as_wkb(x, ...)
## Default S3 method:
as_wkb(x, ...)
## S3 method for class 'character'
as_wkb(x, ..., crs = NULL, geodesic = FALSE)
## S3 method for class 'wk_wkb'
as_wkb(x, ...)
## S3 method for class 'blob'
as_wkb(x, ..., crs = NULL, geodesic = FALSE)
## S3 method for class 'WKB'
as_wkb(x, ..., crs = NULL, geodesic = FALSE)
```
Arguments

x A list() of raw() vectors or NULL.
crs A value to be propagated as the CRS for this vector.
geodesic TRUE if edges must be interpolated as geodesics when coordinates are spherical, FALSE otherwise.
...

Value

A new_wk_wkb()

Examples

as_wkb("POINT (20 10)")

Description

Convert well-known binary to hex

Usage

wkb_to_hex(x)

Arguments

x A wkb() vector

Value

A hex encoded wkb() vector

Examples

x <- as_wkb(xyz(1:5, 6:10, 11:15))
wkb_to_hex(x)
### wkb_translate_wkt

**Deprecated functions**

**Description**

These functions are deprecated and will be removed in a future version.

**Usage**

```r
wkb_translate_wkt(wkb, ..., precision = 16, trim = TRUE)
wkb_translate_wkb(wkb, ..., endian = NA_integer_)
wkt_translate_wkt(wkt, ..., precision = 16, trim = TRUE)
wkt_translate_wkb(wkt, ..., endian = NA_integer_)
```

**Arguments**

- `wkb`: A list() of raw() vectors, such as that returned by sf::st_as_binary().
- `...`: Used to keep backward compatibility with previous versions of these functions.
- `precision`: The rounding precision to use when writing (number of decimal places).
- `trim`: Trim unnecessary zeroes in the output?
- `endian`: Force the endian of the resulting WKB.
- `wkt`: A character vector containing well-known text.

### wkt

**Mark character vectors as well-known text**

**Description**

Mark character vectors as well-known text

**Usage**

```r
wkt(x = character(), crs = wk_crs_auto(), geodesic = FALSE)
parse_wkt(x, crs = wk_crs_auto(), geodesic = FALSE)
as_wkt(x, ...)
```

```r
## Default S3 method:
as_wkt(x, ...)
```
## S3 method for class 'character'
as_wkt(x, ..., crs = NULL, geodesic = FALSE)

## S3 method for class 'wk_wkt'
as_wkt(x, ...)

### Arguments

- **x**: A `character()` vector containing well-known text.
- **crs**: A value to be propagated as the CRS for this vector.
- **geodesic**: TRUE if edges must be interpolated as geodesics when coordinates are spherical, FALSE otherwise.
- **...**: Unused

### Value

A `new_wk_wkt()`

### Examples

```r
wkt("POINT (20 10)")
```

---

### Description

2D bounding rectangles

### Usage

```r
wk_bbox(handleable, ...)
wk_envelope(handleable, ...)
```

```r
## Default S3 method:
wk_bbox(handleable, ...)
## Default S3 method:
wk_envelope(handleable, ...)

## S3 method for class 'wk_rct'
wk_envelope(handleable, ...)

## S3 method for class 'wk_crc'
wk_envelope(handleable, ...)
```
## S3 method for class 'wk_xy'
wk_envelope(handleable, ...)

wk_bbox_handler()

wk_envelope_handler()

### Arguments

- **handleable**: A geometry vector (e.g., \texttt{wkb()}, \texttt{wkt()}, \texttt{xy()}, \texttt{rct()}, or \texttt{sf::st_sfc()}) for which \texttt{wk_handle()} is defined.
- **...**: Passed to the \texttt{wk_handle()} method.

### Value

A \texttt{rct()} of length 1.

### Examples

```r
wk_bbox(wkt("LINESTRING (1 2, 3 5)"))
```
wk_count

Arguments

- `n_chunks, chunk_size`
  - Exactly one of the number of chunks or the chunk size. For `wk_chunk_strategy_feature()` the chunk size refers to the number of features; for `wk_chunk_strategy_coordinates()` this refers to the number of coordinates as calculated from multiple handleables using `reduce`.

- `reduce`
  - For `wk_chunk_strategy_coordinates()` this refers to the function used with `Reduce()` to combine coordinate counts from more than one handleable.

Value

A function that returns a `data.frame` with columns from and to when called with a handleable and the feature count.

Examples

```r
feat <- c(as_wkt(xy(1:4, 1:4)), wkt("LINESTRING (1 1, 2 2)"))
wk_chunk_strategy_single()(list(feat), 5)
wk_chunk_strategy_feature(chunk_size = 2)(list(feat), 5)
wk_chunk_strategy_coordinates(chunk_size = 2)(list(feat), 5)
```

Description

Counts the number of geometries, rings, and coordinates found within each feature. As opposed to `wk_meta()`, this handler will iterate over the entire geometry.

Usage

```r
wk_count(handleable, ...)
```

## Default S3 method:
```r
wk_count(handleable, ...)
```

```r
wk_count_handler()
```

Arguments

- `handleable` A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.

- `...` Passed to the `wk_handle()` method.
Value

A data.frame with one row for every feature encountered and columns:

- n_geom: The number of geometries encountered, including the root geometry. Will be zero for a null feature.
- n_ring: The number of rings encountered. Will be zero for a null feature.
- n_coord: The number of coordinates encountered. Will be zero for a null feature.

Examples

```r
wk_count(as_wkt("LINESTRING (0 0, 1 1)"))
wk_count(as_wkb("LINESTRING (0 0, 1 1)"))
```

Description

The wk package doesn't operate on CRS objects, but does propagate them through subsetting and concatenation. A CRS object can be any R object, and x can be any object whose 'crs' attribute carries a CRS. These functions are S3 generics to keep them from being used on objects that do not use this system of CRS propagation.

Usage

```r
wk_crs(x)
```

## S3 method for class 'wk_vctr'
```r
wk_crs(x)
```

## S3 method for class 'wk_rcrd'
```r
wk_crs(x)
```

```r
wk_crs(x) <- value
wk_set_crs(x, crs)
wk_crs_output(...)
wk_is_geodesic_output(...)
```

Arguments

- `x, ...`: Objects whose "crs" attribute is used to carry a CRS.
- `value`: See crs.
- `crs`: An object that can be interpreted as a CRS.
**wk_crs_equal**  
*Compare CRS objects*

**Description**

The `wk_crs_equal()` function uses special S3 dispatch on `wk_crs_equal_generic()` to evaluate whether or not two CRS values can be considered equal. When implementing `wk_crs_equal_generic()`, every attempt should be made to make `wk_crs_equal(x, y)` and `wk_crs_equal(y, x)` return identically.

**Usage**

```r
wk_crs_equal(x, y)
```

```r
wk_crs_equal_generic(x, y, ...)
```

**Arguments**

- `x, y`  
  Objects stored in the `crs` attribute of a vector.
- `...`  
  Unused

**Value**

`TRUE` if `x` and `y` can be considered equal, `FALSE` otherwise.

**wk_crs_inherit**  
*Special CRS values*

**Description**

The CRS handling in the `wk` package requires two sentinel CRS values. The first, `wk_crs_inherit()`, signals that the vector should inherit a CRS of another vector if combined. This is useful for empty, `NULL`, and/or zero-length geometries. The second, `wk_crs_auto()`, is used as the default argument of `crs` for constructors so that zero-length geometries are assigned a CRS of `wk_crs_inherit()` by default.

**Usage**

```r
wk_crs_inherit()
```

```r
wk_crs_longlat(crs = NULL)
```

```r
wk_crs_auto()
```

```r
wk_crs_auto_value(x, crs)
```
**wk_crs_proj_definition**

**Arguments**

- **crs**
  A value for the coordinate reference system supplied by the user.

- **x**
  A raw input to a constructor whose length and crs attribute is used to determine the default CRS returned by `wk_crs_auto()`.

**Examples**

```r
wk_crs_auto_value(list(), wk_crs_auto())
wk_crs_auto_value(list(), 1234)
wk_crs_auto_value(list(NULL), wk_crs_auto())
```

---

**wk_crs_proj_definition**

**CRS object generic methods**

**Description**

CRS object generic methods

**Usage**

```r
wk_crs_proj_definition(crs, proj_version = NULL, verbose = FALSE)
wk_crs_projjson(crs)
```

```r
## S3 method for class 'NULL'
wk_crs_proj_definition(crs, proj_version = NULL, verbose = FALSE)
```

```r
## S3 method for class 'wk_crs_inherit'
wk_crs_proj_definition(crs, proj_version = NULL, verbose = FALSE)
```

```r
## S3 method for class 'character'
wk_crs_proj_definition(crs, proj_version = NULL, verbose = FALSE)
```

```r
## S3 method for class 'double'
wk_crs_proj_definition(crs, proj_version = NULL, verbose = FALSE)
```

```r
## S3 method for class 'integer'
wk_crs_proj_definition(crs, proj_version = NULL, verbose = FALSE)
```

**Arguments**

- **crs**
  An arbitrary R object

- **proj_version**
  A `package_version()` of the PROJ version, or NULL if the PROJ version is unknown.
verbose Use TRUE to request a more verbose version of the PROJ definition (e.g., PROJJSON). The default of FALSE should return the most compact version that completely describes the CRS. An authority:code string (e.g., "OGC:CRS84") is the recommended way to represent a CRS when verbose is FALSE, if possible, falling back to the most recent version of WKT2 or PROJJSON.

Value

- wk_crs_proj_definition() Returns a string used to represent the CRS in PROJ. For recent PROJ version you’ll want to return PROJJSON; however you should check proj_version if you want this to work with older versions of PROJ.
- wk_crs_projjson() Returns a PROJJSON string or NA_character_ if this representation is unknown or can’t be calculated.

Examples

```
wk_crs_proj_definition("EPSG:4326")
```

wk_debug

Debug filters and handlers

Description

Debug filters and handlers

Usage

```
wk_debug(handleable, handler = wk_void_handler(), ...)
wk_debug_filter(handler = wk_void_handler())
```

Arguments

- handleable A geometry vector (e.g., wkb(), wkt(), xy(), rct(), or sf::st_sfc()) for which wk_handle() is defined.
- handler A wk_handler object.
- ... Passed to the wk_handle() method.

Value

The result of the handler.

Examples

```
wk_debug(wkt("POINT (1 1)"))
wk_handle(wkt("POINT (1 1)"), wk_debug_filter())
```
wk_example

Create example geometry objects

Description

Create example geometry objects

Usage

wk_example(which = "nc", crs = NA, geodesic = FALSE)

wk_example_wkt

Arguments

which
An example name. Valid example names are
- "nc" (data derived from the sf package)
- "point", "linestring", "polygon", "multipoint", "multilinestring", "multipolygon", "geometrycollection"
- One of the above with the ".z", ".m", or ".zm" suffix.

crs
An object that can be interpreted as a CRS

geodesic
TRUE if edges must be interpolated as geodesics when coordinates are spherical, FALSE otherwise.

Format

An object of class list of length 29.

Value

A wkt() with the specified example.

Examples

wk_example("polygon")
wk_flatten

Extract simple geometries

Description

Extract simple geometries

Usage

wk_flatten(handleable, ..., max_depth = 1)

wk_flatten_filter(handler, max_depth = 1L, add_details = FALSE)

Arguments

handleable A geometry vector (e.g., wkb(), wkt(), xy(), rct(), or sf::st_sfc()) for which wk_handle() is defined.

... Passed to the wk_handle() method.

max_depth The maximum (outer) depth to remove.

handler A wk_handler object.

add_details Use TRUE to add a "wk_details" attribute, which contains columns feature_id, part_id, and ring_id.

Value

handleable transformed such that collections have been expanded and only simple geometries (point, linestring, polygon) remain.

Examples

wk_flatten(wkt("MULTIPOINT (1 1, 2 2, 3 3)"))

wk_flatten(
  wkt("GEOMETRYCOLLECTION (GEOMETRYCOLLECTION (GEOMETRYCOLLECTION (POINT (0 1))))"),
  max_depth = 2
)
**Format well-known geometry for printing**

**Description**

Provides an abbreviated version of the well-known text representation of a geometry. This returns a constant number of coordinates for each geometry, so is safe to use for geometry vectors with many (potentially large) features. Parse errors are passed on to the format string and do not cause this handler to error.

**Usage**

```r
wk_format(handleable, precision = 7, trim = TRUE, max_coords = 6, ...)
```

```r
wkt_format_handler(precision = 7, trim = TRUE, max_coords = 6)
```

**Arguments**

- `handleable`: A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.
- `precision`: If `trim` is `TRUE`, the total number of significant digits to keep for each result or the number of digits after the decimal place otherwise.
- `trim`: Use `FALSE` to keep trailing zeroes after the decimal place.
- `max_coords`: The maximum number of coordinates to include in the output.
- `...`: Passed to the `wk_handle()` method.

**Value**

A character vector of abbreviated well-known text.

**Examples**

```r
wk_format(wkt("MULTIPOLYGON (((0 0, 10 0, 0 10, 0 0))"))
wk_format(new_wk_wkt("POINT ENTPY"))
wk_handle(
  wkt("MULTIPOLYGON (((0 0, 10 0, 0 10, 0 0))"),
  wkt_format_handler()
)
```
Use data.frame with wk

Description
Use data.frame with wk

Usage

```r
## S3 method for class 'data.frame'
wk_handle(handleable, handler, ...)

## S3 method for class 'data.frame'
wk_restore(handleable, result, ...)

## S3 method for class 'tbl_df'
wk_restore(handleable, result, ...)

## S3 method for class 'data.frame'
wk_translate(handleable, to, ...)

## S3 method for class 'tbl_df'
wk_translate(handleable, to, ...)

## S3 method for class 'sf'
wk_translate(handleable, to, ...)

## S3 method for class 'sf'
wk_restore(handleable, result, ...)
```

Arguments

- **handleable**: A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.
- **handler**: A `wk_handler` object.
- **...**: Passed to the `wk_handle()` method.
- **result**: The result of a filter operation intended to be a transformation.
- **to**: A prototype object.

Examples

```r
wk_handle(data.frame(a = wkt("POINT (0 1)")), wkb_writer())
wk_translate(wkt("POINT (0 1)"), data.frame(col_name = wkb()))
wk_translate(data.frame(a = wkt("POINT (0 1)")), data.frame(wkb()))
```
Description

The handler is the basic building block of the wk package. In particular, the `wk_handle()` generic allows operations written as handlers to "just work" with many different input types. The wk package provides the `wk_void()` handler, the `wk_format()` handler, the `wk_debug()` handler, the `wk_problems()` handler, and `wk_writer()`s for `wkb()`, `wkt()`, `xy()`, and `sf::st_sfc()` vectors.

Usage

```r
## S3 method for class 'wk_crc'
wk_handle(
  handleable,
  handler,
  ...
)

## S3 method for class 'wk_rct'
wk_handle(handleable, handler, ...)

## S3 method for class 'sfc'
wk_handle(handleable, handler, ...)

## S3 method for class 'wk_wkb'
wk_handle(handleable, handler, ...)

## S3 method for class 'wk_wkt'
wk_handle(handleable, handler, ...)

## S3 method for class 'wk_xy'
wk_handle(handleable, handler, ...)

is_handleable(handleable)

new_wk_handler(handler_ptr, subclass = character())

is_wk_handler(handler)

as_wk_handler(handler, ...)

## S3 method for class 'sfc'
```
wk_handle(handleable, handler, ...)  

## S3 method for class 'sf'
wk_handle(handleable, handler, ...)  

## S3 method for class 'bbox'
wk_handle(handleable, handler, ...)  

**Arguments**

- **handleable**: A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.
- **handler**: A `wk_handler` object.
- **...**: Passed to the `wk_handle()` method.
- **n_segments, resolution**: The number of segments to use when approximating a circle. The default uses `getOption("wk.crc_n_segments")` so that this value can be set for implicit conversions (e.g., `as_wkb()`). Alternatively, set the minimum distance between points on the circle (used to estimate `n_segments`). The default is obtained using `getOption("wk.crc_resolution")`.
- **handler_ptr**: An external pointer to a newly created WK handler subclass.
- **subclass**: The handler subclass.

**Value**

A WK handler.

**Description**

Handler interface for grid objects

**Usage**

```r
## S3 method for class 'wk_grd_xy'
wk_handle(handleable, handler, ..., data_order = c("y", "x"))

## S3 method for class 'wk_grd_rct'
wk_handle(handleable, handler, ..., data_order = c("y", "x"))
```
Arguments

handleable   A geometry vector (e.g., \texttt{wkb()}, \texttt{wkt()}, \texttt{xy()}, \texttt{rct()}, or \texttt{sf::st_sfc()}) for which \texttt{wk_handle()} is defined.

handler      A \texttt{wk_handler} object.

\ldots   Passed to the \texttt{wk_handle()} method.

data_order   A vector of length 2 describing the order in which values should appear. The default, \texttt{c(“y”, “x”)}, will output values in the same order as the default matrix storage in R (column-major). You can prefix a dimension with - to reverse the order of a dimension (e.g., \texttt{c(“-y”, “x”)}).

Value

The result of the handler.

Examples

\begin{verbatim}
wk_handle(grd(nx = 3, ny = 3), wkt_writer())
wk_handle(grd(nx = 3, ny = 3, type = "centers"), wkt_writer())
\end{verbatim}
to = NULL,
...
)

Arguments

handleable  A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.
handler     A `wk_handler` object.
from         1-based index of the feature to start from
to           1-based index of the feature to end at
...          Passed to the `wk_handle()` method.

Value

A subset of `handleable`

Examples

```r
wk_handle_slice(xy(1:5, 1:5), wkt_writer(), from = 3, to = 5)
wk_handle_slice(
  data.frame(let = letters[1:5], geom = xy(1:5, 1:5)),
  wkt_writer(),
  from = 3, to = 5
)
```

---

**wk_identity**  
*Copy a geometry vector*

Description

Copy a geometry vector

Usage

```r
wk_identity(handleable, ...)
wk_identity_filter(handler)
wk_restore(handleable, result, ...)
```

## Default S3 method:
```r
wk_restore(handleable, result, ...)
```
Arguments

handleable  A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.

`...`  Passed to the `wk_handle()` method.

handler  A `wk_handler` object.

result  The result of a filter operation intended to be a transformation.

Value

A copy of handleable.

Examples

```r
wk_identity(wkt("POINT (1 2)"))
```

---

**wk_is_geodesic**

*Set and get vector geodesic edge interpolation*

Description

Set and get vector geodesic edge interpolation

Usage

```r
wk_is_geodesic(x)
wk_set_geodesic(x, geodesic)
wk_is_geodesic(x) <- value
wk_geodesic_inherit()
```

Arguments

- `x`  An R object that contains edges
- `geodesic`  TRUE if edges must be interpolated as geodesics when coordinates are spherical, FALSE otherwise.
- `value`  See `geodesic`.

Value

TRUE if edges must be interpolated as geodesics when coordinates are spherical, FALSE otherwise.
**wk_linestring**  
*Create lines, polygons, and collections*

**Description**
Create lines, polygons, and collections

**Usage**

\[
\text{wk_linestring}(\text{handleable}, \text{feature_id} = 1L, \ldots, \text{geodesic} = \text{NULL})
\]

\[
\text{wk_polygon}(\text{handleable}, \text{feature_id} = 1L, \text{ring_id} = 1L, \ldots, \text{geodesic} = \text{NULL})
\]

\[
\text{wk_collection}(\\text{handleable},
\text{\quad geometry_type = wk\_geometry\_type("geometrycollection"),}
\text{\quad feature_id = 1L,}
\text{\quad \ldots}
\)
\]

\[
\text{wk_linestring\_filter}(\text{handler}, \text{feature_id} = 1L)
\]

\[
\text{wk_polygon\_filter}(\text{handler}, \text{feature_id} = 1L, \text{ring_id} = 1L)
\]

\[
\text{wk_collection\_filter}(\\\text{handler},
\text{\quad geometry_type = wk\_geometry\_type("geometrycollection"),}
\text{\quad feature_id = 1L}
\)
\]

**Arguments**

- **handleable**: A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.
- **feature_id**: An identifier where changes in sequential values indicate a new feature. This is recycled silently as needed.
- **...**: Passed to the `wk_handle()` method.
- **geodesic**: Use `TRUE` or `FALSE` to explicitly force the geodesic-ness of the output.
- **ring_id**: An identifier where changes in sequential values indicate a new ring. Rings are automatically closed. This is recycled silently as needed.
- **geometry_type**: The collection type to create.
- **handler**: A `wk_handler` object.

**Value**
An object of the same class as `handleable` with whose coordinates have been assembled into the given type.
Examples

wk_linestring(xy(c(1, 1), c(2, 3)))
wk_polygon(xy(c(0, 1, 0), c(0, 0, 1)))
wk_collection(xy(c(1, 1), c(2, 3)))

Description

These functions return the non-coordinate information of a geometry and/or vector. They do not parse an entire geometry/vector and are intended to be very fast even for large vectors.

Usage

wk_meta(handleable, ...)

## Default S3 method:
wk_meta(handleable, ...)

wk_vector_meta(handleable, ...)

## Default S3 method:
wk_vector_meta(handleable, ...)

wk_meta_handler()

wk_vector_meta_handler()

wk_geometry_type_label(geometry_type)

wk_geometry_type(geometry_type)

Arguments

handleable  A geometry vector (e.g., wkb(), wkt(), xy(), rct(), or sf::st_sfc()) for which wk_handle() is defined.

...  Passed to the wk_handle() method.

geometry_type  An integer code for the geometry type. These integers follow the WKB specification (e.g., 1 for point, 7 for geometrycollection).

geometry_type_label  A character vector of (lowercase) geometry type labels as would be found in WKT (e.g., point, geometrycollection).
Value

A data.frame with columns:

- `geometry_type`: An integer identifying the geometry type. A value of 0 indicates that the types of geometry in the vector are not known without parsing the entire vector.
- `size`: For points and linestrings, the number of coordinates; for polygons, the number of rings; for collections, the number of child geometries. A value of zero indicates an EMPTY geometry. A value of NA means this value is unknown without parsing the entire geometry.
- `has_z`: TRUE if coordinates contain a Z value. A value of NA means this value is unknown without parsing the entire vector.
- `has_m`: TRUE if coordinates contain an M value. A value of NA means this value is unknown without parsing the entire vector.
- `sril`: An integer identifying a CRS or NA if this value was not provided.
- `precision`: A grid size or 0.0 if a grid size was not provided. Note that coordinate values may not have been rounded; the grid size only refers to the level of detail with which they should be interpreted.
- `is_empty`: TRUE if there is at least one non-empty coordinate. For the purposes of this value, a non-empty coordinate is one that contains at least one value that is not NA or NaN.

Examples

```r
wk_vector_meta(as_wkt("LINESTRING (0 0, 1 1)"))
wk_meta(as_wkt("LINESTRING (0 0, 1 1)"))
wk_meta(as_wkb("LINESTRING (0 0, 1 1)"))

wk_geometry_type_label(1:7)
wk_geometry_type(c("point", "geometrycollection"))
```

---

**wk_orient**  
**Orient polygon coordinates**

Description

Orient polygon coordinates

Usage

```r
wk_orient(handleable, ..., direction = wk_counterclockwise())
wk_orient_filter(handler, direction = wk_counterclockwise())
wk_clockwise()
wk_counterclockwise()
```
Arguments

handleable A geometry vector (e.g., wkb(), wkt(), xy(), rct(), or sf::st_sfc()) for which wk_handle() is defined.

Passed to the wk_handle() method.

direction The winding polygon winding direction

handler A wk_handler object.

Value

handleable with consistently oriented polygons, in direction winding order.

Examples

```r
wk_orient(wkt("POLYGON ((0 0, 1 0, 1 1, 0 1, 0 0))"))
wk_orient(
  wkt("POLYGON ((0 0, 0 1, 1 1, 1 0, 0 0))"),
  direction = wk_clockwise()
)
```

Description

Plot well-known geometry vectors

Usage

```r
wk_plot(
  handleable,
  ..., asp = 1,
  bbox = NULL,
  xlab = "",
  ylab = "",
  rule = "evenodd",
  add = FALSE
)
```

## Default S3 method:
wk_plot(
  handleable,
  ..., asp = 1,
  bbox = NULL,
```
Arguments

- `handleable`: A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.
- `...`: Passed to plotting functions for features: `graphics::points()` for point and multipoint geometries, `graphics::lines()` for linestring and multilinestring geometries, and `graphics::polypath()` for polygon and multipolygon geometries.
- `asp, xlab, ylab`: Passed to `graphics::plot()`
**bbox**  The limits of the plot as a `rct()` or compatible object

**rule**  The rule to use for filling polygons (see `graphics::polypath()`)

**add**  Should a new plot be created, or should handleable be added to the existing plot?

**x**  A `wkb()` or `wkt()`

**Value**

The input, invisibly.

**Examples**

```r
plot(as_wkt("LINESTRING (0 0, 1 1)"))
plot(as_wkb("LINESTRING (0 0, 1 1)"))
```

---

**wk_problems**

Validate well-known binary and well-known text

**Description**

The problems handler returns a character vector of parse errors and can be used to validate input of any type for which `wk_handle()` is defined.

**Usage**

```r
wk_problems(handleable, ...)
wk_problems_handler()
```

**Arguments**

- **handleable**  A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.

- **...**  Passed to the `wk_handle()` method.

**Value**

A character vector of parsing errors. NA signifies that there was no parsing error.

**Examples**

```r
wk_problems(new_wk_wkt(c("POINT EMTPY", "POINT (20 30)")))
wk_handle(
  new_wk_wkt(c("POINT EMTPY", "POINT (20 30)")),
  wk_problems_handler()
)
```
**wk_proj_crs_view**  
*Common CRS Representations*

**Description**

These fixtures are calculated from PROJ version 9.1.0 and the database built from its source. They are used internally to transform and inspect coordinate reference systems.

**Usage**

```r
wk_proj_crs_view

wk_proj_crs_json
```

**Format**

An object of class `data.frame` with 13387 rows and 7 columns.

An object of class `data.frame` with 13387 rows and 3 columns.

**Examples**

```r
head(wk_proj_crs_view)

colnames(wk_proj_crs_json)
```

---

**wk_set_z**  
*Set coordinate values*

**Description**

Set coordinate values

**Usage**

```r
wk_set_z(handleable, z, ...)

wk_set_m(handleable, m, ...)

wk_drop_z(handleable, ...)

wk_drop_m(handleable, ...)

wk_trans_set(value, use_z = NA, use_m = NA)
```
Arguments

**handleable**  A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.

**z, m**  A vector of Z or M values applied feature-wise and recycled along `handleable`. Use NA to keep the existing value of a given feature.

**...**  Passed to the `wk_handle()` method.

**value**  An `xy()`, `xyz()`, `xym()`, or `xyzm()` of coordinates used to replace values in the input. Use NA to keep the existing value.

**use_z, use_m**  Used to declare the output type. Use TRUE to ensure the output has that dimension, FALSE to ensure it does not, and NA to leave the dimension unchanged.

Examples

```r
wk_set_z(wkt("POINT (0 1)"), 2)
wk_set_m(wkt("POINT (0 1)"), 2)
wk_drop_z(wkt("POINT ZM (0 1 2 3)"))
wk_drop_m(wkt("POINT ZM (0 1 2 3)"))
```

---

**wk_transform**  
*Apply coordinate transformations*

Description

Apply coordinate transformations

Usage

```r
wk_transform(handleable, trans, ...)
wk_transform_filter(handler, trans)
```

Arguments

**handleable**  A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.

**trans**  An external pointer to a `wk_trans` object

**...**  Passed to the `wk_handle()` method.

**handler**  A `wk_handler` object.

Examples

```r
wk_transform(xy(0, 0), wk_affine_translate(2, 3))
```
**wk_translate.sfc**  
*Translate geometry vectors*

**Description**
Translate geometry vectors

**Usage**
```r
## S3 method for class 'sfc'
wk_translate(handleable, to, ...)  
wk_translate(handleable, to, ...)  
## Default S3 method:
wk_translate(handleable, to, ...)
```

**Arguments**
- `handleable`: A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.
- `to`: A prototype object.
- `...`: Passed to the `wk_handle()` method.

---

**wk_trans_affine**  
*Affine transformer*

**Description**
Affine transformer

**Usage**
```r
wk_trans_affine(trans_matrix)
wk_affine_identity()
wk_affine_rotate(rotation_deg)
wk_affine_scale(scale_x = 1, scale_y = 1)
wk_affine_translate(dx = 0, dy = 0)
wk_affine_fit(src, dst)
```
wk_trans_explicit

wk_affine_rescale(rct_in, rct_out)

wk_affine_compose(...)

wk_affine_invert(x)

Arguments

- **trans_matrix**: A 3x3 transformation matrix
- **rotation_deg**: A rotation to apply in degrees counterclockwise.
- **scale_x, scale_y**: Scale factor to apply in the x and y directions, respectively
- **dx, dy**: Coordinate offsets in the x and y direction
- **src, dst**: Point vectors of control points used to estimate the affine mapping (using `base::qr.solve()`).
- **rct_in, rct_out**: The input and output bounds
- **...**: Zero or more transforms in the order they should be applied.
- **x**: A `wk_trans_affine()`

---

**wk_trans_explicit**  
*Transform using explicit coordinate values*

---

**Description**

A `wk_trans` implementation that replaces coordinate values using a vector of pre-calculated coordinates. This is used to perform generic transforms using R functions and system calls that are impossible or impractical to implement at the C level.

**Usage**

```
wk_trans_explicit(value, use_z = NA, use_m = NA)
```

**Arguments**

- **value**: An `xy()`, `xyz()`, `xym()`, or `xyzm()` of coordinates used to replace values in the input. Use NA to keep the existing value.
- **use_z, use_m**: Used to declare the output type. Use TRUE to ensure the output has that dimension, FALSE to ensure it does not, and NA to leave the dimension unchanged.

**See Also**

- `wk_coords()` which has a replacement version "wk_coords<-

**Examples**

```
trans <- wk_trans_explicit(xy(1:5, 1:5))
wk_transform(rep(xy(0, 0), 5), trans)
```
**wk_trans_inverse**

*Generic transform class*

**Description**

Generic transform class

**Usage**

```r
wk_trans_inverse(trans, ...)
```

```r
as_wk_trans(x, ...)
```

```r
## S3 method for class 'wk_trans'
as_wk_trans(x, ...)
```

```r
new_wk_trans(trans_ptr, subclass = character())
```

**Arguments**

- `trans`: An external pointer to a `wk_trans` object
- `...`: Passed to S3 methods
- `x`: An object to be converted to a transform.
- `trans_ptr`: An external pointer to a `wk_trans_t` transform struct.
- `subclass`: An optional subclass to apply to the pointer

---

**wk_vertices**

*Extract vertices*

**Description**

These functions provide ways to extract individual coordinate values. Whereas `wk_vertices()` returns a vector of coordinates as in the same format as the input, `wk_coords()` returns a data frame with coordinates as columns.

**Usage**

```r
wk_vertices(handleable, ...)
```

```r
wk_coords(handleable, ...)
```

```r
wk_coords(handleable, use_z = NA, use_m = NA) <- value
```

```r
wk_vertex_filter(handler, add_details = FALSE)
```
**Argument**

- `handleable`: A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.
- `use_z`, `use_m`: Used to declare the output type. Use `TRUE` to ensure the output has that dimension, `FALSE` to ensure it does not, and `NA` to leave the dimension unchanged.
- `value`: An `xy()`, `xyz()`, `xym()`, or `xyzm()` of coordinates used to replace values in the input. Use `NA` to keep the existing value.
- `handler`: A `wk_handler` object.
- `add_details`: Use `TRUE` to add a “wk_details” attribute, which contains columns `feature_id`, `part_id`, and `ring_id`.

**Details**

`wk_coords<-` is the replacement-function version of `wk_coords`. Using the engine of `wk_trans_explicit()` the coordinates of an object can be transformed in a generic way using R functions as needed.

**Value**

- `wk_vertices()` extracts vertices and returns the in the same format as the handler
- `wk_coords()` returns a data frame with columns columns `feature_id` (the index of the feature from whence it came), `part_id` (an arbitrary integer identifying the point, line, or polygon from whence it came), `ring_id` (an arbitrary integer identifying individual rings within polygons), and one column per coordinate (x, y, and/or z and/or m).

**Examples**

```r
wk_vertices(wkt("LINESTRING (0 0, 1 1)"))
wk_coords(wkt("LINESTRING (0 0, 1 1)"))
```

```r
# wk_coords() replacement function
x <- xy(1:5, 1:5)
y <- as_wkt(x)
wk_coords(y) <- cbind(5:1, 0:4)
wk_coords(x) <- y[5:1]
y
x
```

---

**Description**

This handler does nothing and returns `NULL`. It is useful for benchmarking readers and handlers and when using filters that have side-effects (e.g., `wk_debug()`). Note that this handler stops on the first parse error; to see a list of parse errors see the `wk_problems()` handler.
Usage

wk_void(handleable, ...)
wk_void_handler()

Arguments

handleable A geometry vector (e.g., wkb(), wkt(), xy(), rct(), or sf::st_sfc()) for which wk_handle() is defined.
...
Passed to the wk_handle() method.

Value

NULL

Examples

wk_void(wkt("POINT (1 4)"))
wk_handle(wkt("POINT (1 4)"), wk_void_handler())

Description

When writing transformation functions, it is often useful to know which handler should be used to create a (potentially modified) version of an object. Some transformers (e.g., wk_vertices()) modify the geometry type of an object, in which case a generic writer is needed. This defaults to wkb_writer() because it is fast and can handle all geometry types.

Usage

## S3 method for class 'sfc'
wk_writer(handleable, ...)

## S3 method for class 'sf'
wk_writer(handleable, ...)

sfc_writer(promote_multi = FALSE)
wkb_writer(buffer_size = 2048L, endian = NA_integer_)
wkt_writer(precision = 16L, trim = TRUE)
wk_writer(handleable, ..., generic = FALSE)
## Default S3 method:
wk_writer(handleable, ...)

## S3 method for class 'wk_wkt'
wk_writer(handleable, ..., precision = 16, trim = TRUE)

## S3 method for class 'wk_wkb'
wk_writer(handleable, ...)

## S3 method for class 'wk_xy'
wk_writer(handleable, ..., generic = FALSE)

xy_writer()

**Arguments**

- **handleable**
  A geometry vector (e.g., `wkb()`, `wkt()`, `xy()`, `rct()`, or `sf::st_sfc()`) for which `wk_handle()` is defined.

- **...**
  Passed to the writer constructor.

- **promote_multi**
  Use TRUE to promote all simple geometries to a multi type when reading to sfc. This is useful to increase the likelihood that the sfc will contain a single geometry type.

- **buffer_size**
  Control the initial buffer size used when writing WKB.

- **endian**
  Use 1 for little endian, 0 for big endian, or NA for system endian.

- **precision**
  If trim is TRUE, the total number of significant digits to keep for each result or the number of digits after the decimal place otherwise.

- **trim**
  Use FALSE to keep trailing zeroes after the decimal place.

- **generic**
  Use TRUE to obtain a writer that can write all geometry types.

**Value**

A `wk_handler`.

---

**xy**

*Efficient point vectors*

**Description**

Efficient point vectors
Usage

xy(x = double(), y = double(), crs = wk_crs_auto())

xyz(x = double(), y = double(), z = double(), crs = wk_crs_auto())

xym(x = double(), y = double(), m = double(), crs = wk_crs_auto())

xyzm(x = double(), y = double(), z = double(), m = double(), crs = wk_crs_auto())

xy_dims(x)

as_xy(x, ...)

## Default S3 method:
## S3 method for class 'wk_xy'
## S3 method for class 'matrix'
## S3 method for class 'data.frame'

Arguments

x, y, z, m  Coordinate values.
crs  A value to be propagated as the CRS for this vector.
...  Passed to methods.
dims  A set containing one or more of c("x", "y", "z", "m").

Value

A vector of coordinate values.

Examples

xy(1:5, 1:5)
xyz(1:5, 1:5, 10)
xym(1:5, 1:5, 10)
xyzm(1:5, 1:5, 10, 12)
xy_x

# NA, NA maps to a null/na feature; NaN, NaN maps to EMPTY
as_wkt(xy.NaN, NaN)
as_wkt(xy(NA, NA))

<table>
<thead>
<tr>
<th>xy_x</th>
<th>XY vector extractors</th>
</tr>
</thead>
</table>

Description

XY vector extractors

Usage

xy_x(x)
xy_y(x)
xy_z(x)
xy_m(x)

Arguments

x An xy() vector

Value

Components of the xy() vector or NULL if the dimension is missing

Examples

x <- xyz(1:5, 6:10, 11:15)
xy_x(x)
xy_y(x)
xy_z(x)
xy_m(x)
