### df_to_x3p

Convert a data frame into an x3p file

#### Description

Convert a data frame into an x3p file

#### Usage

```r
df_to_x3p(dframe, var = "value")
```

#### Arguments

- `dframe`: data frame. `dframe` must have the columns `x`, `y`, and `value`.
- `var`: name of the variable containing the surface measurements. Defaults to "value".

#### Value

x3p object

### head.x3p

Show meta information of an x3p file

#### Description

`head.x3p` expands the generic head method for x3p objects. It gives a summary of the most relevant 3p meta information and returns the object invisibly.

#### Usage

```r
## S3 method for class 'x3p'
head(x, n = 6L, ...)
```

#### Arguments

- `x`: x3p object
- `n`: number of rows/columns of the matrix
- `...`: extra parameters passed to `head.matrix()`

#### Examples

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
head(logo)
```
image.x3p  

*Raster image of an x3p surface*

**Description**

*image*.x3p expands the generic image method for x3p objects. This image function creates a raster image to show the surface of an x3p file. Due to some inconsistency in the mapping of the origin (0,0), (choice between top left or bottom left) image functions from different packages will result in different images.

**Usage**

```r
## S3 method for class 'x3p'
image(x, ...)
```

**Arguments**

- `x`: an x3p object
- `...`: parameters passed into image

**Examples**

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
image(logo)
```

---

**print.x3p**

*Show meta information of an x3p file*

**Description**

print.x3p expands the generic print method for x3p objects. It gives a summary of the most relevant x3p meta information and returns the object invisibly.

**Usage**

```r
## S3 method for class 'x3p'
print(x, ...)
```

**Arguments**

- `x`: x3p object
- `...`: ignored

**Examples**

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
print(logo)
```
Convert an STL file to an x3p file

Description

STL files describe 3d objects as mesh objects. Here, we assume that the 3d object consists of a 3d surface on the top of a rectangular, equi-spaced 2d grid. We further assume, that each node of the STL file describes the x-y location of an actual measurement. These measurements are then converted into the surface matrix of an x3p object. The resolution is derived from the distance between consecutive x and y nodes.

Usage

stl_to_x3p(stl)

Arguments

stl
STL file object or path to the file

Value

x3p object

Examples

## Not run:
# the website https://touchterrain.geol.iastate.edu/ allows a download
# of a 3d printable terrain model. For an example we suggest to download a file from there.
gc <- rgl::readSTL("<PATH TO STL FILE>", plot=FALSE)
x3p <- stl_to_x3p(gc)
## End(Not run)

Add annotations to an x3p object

Description

Annotations in an x3p object are legend entries for each color of a mask.

Usage

x3p_add_annotation(x3p, color, annotation)
Arguments

- **x3p**: x3p object
- **color**: name or hex value of color
- **annotation**: character value describing the region

Value

x3p object with the added annotations

Examples

```r
## Not run:
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
color_logo <- png::readPNG(system.file("csafe-color.png", package="x3ptools"))
logoplus <- x3p_add_mask(logo, as.raster(color_logo))
x3p_image(logoplus, multiply=50, size = c(419, 741), zoom = 0.5)
logoplus <- x3p_add_annotation(logoplus, "#FFFFFF", "background")
logoplus <- x3p_add_annotation(logoplus, "#818285FF", "text")
logoplus <- x3p_add_annotation(logoplus, "#F6BD47FF", "fingerprint")
logoplus <- x3p_add_annotation(logoplus, "#D2202FFF", "fingerprint")
logoplus <- x3p_add_annotation(logoplus, "#92278FFF", "fingerprint")
x3p_add_legend(logoplus)

## End(Not run)
```

---

**x3p_add_grid**  
*Add a grid of helper lines to the mask of an x3p object*

Description

Add a grid of lines to overlay the surface of an x3p object. Lines are added to a mask. In case no mask exists, one is created.

Usage

```r
x3p_add_grid(
  x3p,  
  spaces,  
  size = c(1, 3, 5),  
  color = c("grey50", "black", "darkred")  
)
```

Arguments

- **x3p**: x3p object
- **spaces**: space between grid lines, doubled for x
- **size**: width (in pixels) of the lines
- **color**: (vector of) character values to describe color of lines
Value

x3p object with added vertical lines in the mask

Examples

## Not run:
logo <- x3p_read(system.file("csafe-logo.x3p", package = "x3ptools"))
# ten vertical lines across:
logoplus <- x3p_add_grid(logo,
    spaces = 50e-6, size = c(1, 3, 5),
    color = c("grey50", "black", "darkred")
)
x3p_image(logoplus, size = c(741, 419), zoom = 0.5)

## End(Not run)

---

x3p_add_hline  
*Add horizontal line to the mask of an x3p object*

Description

Add horizontal lines to overlay the surface of an x3p object. Lines are added to a mask. In case no mask exists, one is created.

Usage

```r
x3p_add_hline(x3p, yintercept, size = 5, color = "#e6bf98")
```

Arguments

- `x3p`: x3p object
- `yintercept`: (vector of) numerical values for the position of the lines.
- `size`: width (in pixels) of the line
- `color`: (vector of) character values to describe color of lines

Value

x3p object with added vertical lines in the mask

Examples

## Not run:
logo <- x3p_read(system.file("csafe-logo.x3p", package = "x3ptools"))
color_logo <- magick::image_read(system.file("csafe-color.png", package = "x3ptools"))
logoplus <- x3p_add_mask(logo, as.raster(color_logo))
# five horizontal lines at equal intervals:
logoplus <- x3p_add_hline(logo, seq(0, 418 * 6.4500e-7, length = 5), size = 3)
x3p_image(logoplus, size = c(741, 419), zoom = 0.5)
### x3p_add_mask

Add/Exchange a mask for an x3p object

**Description**
Create a mask for an x3p object in case it does not have a mask yet. Masks are used for overlaying colors on the bullets surface.

**Usage**

```r
x3p_add_mask(x3p, mask = NULL)
```

**Arguments**

- `x3p` x3p object
- `mask` raster matrix of colors with the same dimensions as the x3p surface. If NULL, an object of the right size will be created.

### x3p_add_legend

Display legend in active rgl object

**Description**
Display the legend for colors and annotations in the active rgl window. In case no rgl window is opened, a new window displaying the x3p file (using default sizes and zoom) opens.

**Usage**

```r
x3p_add_legend(x3p, colors = NULL)
```

**Arguments**

- `x3p` x3p object with a mask
- `colors` named character vector of colors (in hex format by default), names contain annotations

**Examples**

```r
x3p <- x3p_read(system.file("sample-land.x3p", package="x3ptools"))
## Not run:
# run when rgl can open window on the device
x3p_image(x3p)
x3p_add_legend(x3p) # add legend
## End(Not run)
```
**x3p_add_mask_layer**

**Value**

x3p object with added/changed mask

**Examples**

```r
x3p <- x3p_read(system.file("sample-land.x3p", package="x3ptools"))
# x3p file has mask consisting color raster image:
x3p$mask[1:5,1:5]
## Not run:
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
color_logo <- png::readPNG(system.file("csafe-color.png", package="x3ptools"))
logoplus <- x3p_add_mask(logo, as.raster(color_logo))
x3p_image(logoplus, multiply=50, size = c(741, 419),zoom = 0.5)
## End(Not run)
```

**Description**

Add a region a mask. The region is specified as TRUE values in a matrix of the same dimensions as the existing mask. In case no mask exists, one is created.

**Usage**

```r
x3p_add_mask_layer(x3p, mask, color = "red", annotation = ")
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x3p</td>
<td>x3p object</td>
</tr>
<tr>
<td>mask</td>
<td>logical matrix of the same dimension as the surface matrix. Values of TRUE are assumed to be added in the mask, values of FALSE are being ignored.</td>
</tr>
<tr>
<td>color</td>
<td>name or hex value of color</td>
</tr>
<tr>
<td>annotation</td>
<td>character value describing the region</td>
</tr>
</tbody>
</table>

**Value**

x3p object with changed mask
x3p_add_meta  
*Add/change xml meta information in x3p object*

**Description**

Use a specified template to overwrite the general info in the x3p object (and structure of the feature info, if needed).

**Usage**

```r
x3p_add_meta(x3p, template = NULL)
```

```r
addtemplate_x3p(x3p, template = NULL)
```

**Arguments**

- `x3p`: x3p object
- `template`: file path to xml template, use NULL for in-built package template

**Examples**

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
# exchange meta information for general x3p information:
logo <- x3p_add_meta(logo, template = system.file("templateXML.xml", package="x3ptools"))
logo$general.info
```

x3p_add_vline  
*Add vertical line to the mask of an x3p object*

**Description**

Add vertical lines to overlay the surface of an x3p object. Lines are added to a mask. In case no mask exists, one is created.

**Usage**

```r
x3p_add_vline(x3p, xintercept, size = 5, color = "#e6bf98")
```

**Arguments**

- `x3p`: x3p object
- `xintercept`: (vector of) numerical values for the position of the lines.
- `size`: width (in pixels) of the line
- `color`: (vector of) character values to describe color of lines
x3p_average

Value

x3p object with added vertical lines in the mask

Examples

```r
## Not run:
logo <- x3p_read(system.file("csafe-logo.x3p", package = "x3ptools"))
logo_color <- magick::image_read(system.file("csafe-color.png", package = "x3ptools"))
logoplus <- x3p_add_mask(logo, as.raster(logo_color))
# ten vertical lines across:
logoplus <- x3p_add_vline(logo, seq(0, 740 * 6.4500e-7, length = 5), size = 3)
x3p_image(logoplus, size = c(741, 419), zoom = 0.5)

## End(Not run)
```

---

x3p_average  
Average an x3p object

Description

Calculate blockwise summary statistics on the surface matrix of an x3p.

Usage

```r
x3p_average(x3p, b = 10, f = mean, ...)
```

Arguments

- `x3p`: x3p object
- `b`: positive integer value, block size
- `f`: function aggregate function
- `...`: parameters passed on to function f. Make sure to use `na.rm = T` as needed.

Examples

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
small <- x3p_average(logo)
```
Select a circle area on the surface of an x3p file using rgl

Description

In the active rgl window select a circle on the scan’s surface by right-clicking on three points along the circumference. Make sure that x3p file and the rgl window match. If no rgl window is active, an rgl window opens with the scan.

Usage

```
x3p_circle_select(x3p, col = "#FF0000", update = TRUE)
```

Arguments

- `x3p`: x3p file
- `col`: character value of the selection color
- `update`: boolean value, whether the rgl window should be updated to show the selected circle

Value

x3p file with selected circle in mask

Examples

```r
## Not run:
if (interactive) {
  if (!file.exists("fadul1-1.x3p")) {
    file <- "2d9cc51f-6f66-40a0-973a-a9292dbbe36d"
    download.file(file.path(url, file), destfile="fadul1-1.x3p")
  }
  x3p <- x3p_read("fadul1-1.x3p")
  x3p_image(x3p, size=c(500,500), zoom=.8)
  x3p <- x3p_circle_select(x3p, update=TRUE, col="#FF0000")

  logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
  x3p_image(logo, size=c(500,500), zoom = 1)
  x3p_circle_select(logo, update=TRUE, col="#00FF00")
}
## End(Not run)
```
**x3p_crop**

*Crop an x3p object to a specified width and height*

**Description**

Cuts out a rectangle of size width x height from the location (x, y) of an x3p object. x and y specify the bottom right corner of the rectangle. In case the dimensions of the surface matrix do not allow for the full dimensions of the rectangle cutout the dimensions are adjusted accordingly.

**Usage**

```r
x3p_crop(x3p, x = 1, y = 1, width = 128, height = 128)
```

**Arguments**

- **x3p**: x3p object
- **x**: integer, location (in pixels) of the leftmost side of the rectangle,
- **y**: integer, location (in pixels) of the leftmost side of the rectangle,
- **width**: integer, width (in pixels) of the rectangle,
- **height**: integer, height (in pixels) of the rectangle,

**Examples**

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
# crop the x3p file to just the CSAFE logo
logo_only <- x3p_crop(logo, x=20, y=50, width = 255 ,height =310)
logo_only <- x3p_crop(logo, x=20, y=50, width = 255 ,height =510)
# x3p_image(logo_only, size=c(500,500), zoom = 1)
```

---

**x3p_darker**

*Darken active rgl object*

**Description**

Makes the currently active rgl object darker by removing a light source. Once all light sources are removed the object can not be any darker.

**Usage**

```r
x3p_darker()
```
Examples

```r
x3p <- x3p_read(system.file("sample-land.x3p", package="x3ptools"))
## Not run:
x3p_image(x3p) # run when rgl can open window on the device
x3p_darker() # remove a light source
## End(Not run)
```

---

### `x3p_delete_mask`

**Delete mask from an x3p object**

**Description**

Deletes mask and its annotations from an x3p file.

**Usage**

```r
x3p_delete_mask(x3p)
```

**Arguments**

- `x3p`: x3p object

**Value**

x3p object without the mask

---

### `x3p_extract`

**Extract values from a surface matrix based on a mask**

**Description**

If a mask is present, a subset of the surface matrix is extracted based on specified value(s).

**Usage**

```r
x3p_extract(x3p, mask_vals)
```

**Arguments**

- `x3p`: x3p object
- `mask_vals`: vector of mask value(s)

**Value**

x3p object
Examples

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
# add a mask
logo <- x3p_add_mask(logo)
mask <- t(logo$surface.matrix==median(logo$surface.matrix))
logo <- x3p_add_mask_layer(logo, mask, color = "red", annotation = "median")
x3p_extract(logo, "#cd7f32")
# x3p_image(logo, size=c(500,500), zoom = 1)
```

---

x3p_extract_profile  Interactively select a line on the active rgl device

Description

In the active rgl device select a line on the 3d surface by clicking on start and end-point (order matters). These points define the beginning and end of a line segment. The line segment is drawn on the mask of the x3p object. The returned x3p object is expanded by a data frame of surface measurements along the line segment.

Usage

```r
x3p_extract_profile(x3p, col = "#FF0000", update = TRUE, line_out = TRUE)
```

Arguments

- `x3p`: x3p file
- `col`: character value of the selection color
- `update`: boolean value, whether the rgl window should be updated to show the selected circle
- `line_out`: boolean enhance result by a data frame of the line? Note that variable x indicates the direction from first click (x=0) to the second click (max x). The values of x in the result are in the same units as the original x3p.

Value

x3p file with identified in mask enhanced by a dataframe of the line segment (line_df).

Examples

```r
# Not run:
if (interactive) {
x3p <- x3p_read(system.file("sample-land.x3p", package="x3ptools"))
x3p %>% image_x3p(size=dim(x3p$surface.matrix), multiply=1, zoom=.3)
x3p <- x3p_extract_profile(x3p, update=TRUE, col="#FFFFFF")
x3p$line_df %>%
  ggplot(aes(x = x, y = value)) + geom_line()
}
```r
x3p$line_df$y <- 1
sigs <- bulletxtrctr::cc_get_signature(ccdata = x3p$line_df,
grooves = list(groove=c(min(x3p$line_df$x), max(x3p$line_df$x))), span1 = 0.75, span2 = 0.03)
sigs %>%
ggplot(aes(x = x)) +
  geom_line(aes(y = raw_sig), colour = "grey50") +
  geom_line(aes(y = sig), size = 1) +
  theme_bw()
}
## End(Not run)
```

---

**x3p_flip_x**

*Flip the x coordinate of an x3 file*

### Description

Flip the surface matrix of an x3 file along the x axis.

### Usage

```r
x3p_flip_x(x3p)
x_flip_x3p(x3p)
```

### Arguments

- `x3p`: x3p object

### Value

x3p object in which the x coordinate is reversed.

### Examples

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
dim(logo$surface.matrix)
## Not run:
x3p_image(logo)

## End(Not run)
# flip the y-axis for the old ISO standard:
logoflip <- x3p_flip_x(logo)
dim(logoflip$surface.matrix)
## Not run:
x3p_image(logoflip)

## End(Not run)
```
x3p_flip_y

Flip the y coordinate of an x3p image

Description

One of the major changes between the previous two ISO standards is the way the y axis is defined in a scan. The entry (0,0) used to refer to the top left corner of a scan, now it refers to the bottom right corner, which means that all legacy x3p files have to flip their y axis in order to conform to the newest ISO norm.

Usage

x3p_flip_y(x3p)

Arguments

x3p  x3p object

Value

x3p object in which the y coordinate is reversed.

Examples

logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
dim(logo$surface.matrix)
## Not run:
x3p_image(logo)

## End(Not run)

# flip the y-axis for the old ISO standard:
logoflip <- x3p_flip_y(logo)
dim(logoflip$surface.matrix)
## Not run:
x3p_image(logoflip)

## End(Not run)
x3p_fuzzyselect  

Interactive selection of region of interest

Description
Interactive selection of region of interest

Usage
```
x3p_fuzzyselect(x3p, col = "#FF0000", mad = 5, type = "plane", update = TRUE)
```

Arguments

- **x3p**: x3p file
- **col**: character value of the selection color
- **mad**: scalar
- **type**: only "plane" is implemented at the moment
- **update**: boolean value, whether the rgl window should be updated to show the selected rectangle

Value
x3p file with updated mask

Examples
```
## Not run:
if (interactive) {
  if (!file.exists("fadull-1.x3p")) {
    file <- "2d9cc51f-6f66-40a0-973a-a9292dbec3fd"
    download.file(file.path(url, file), destfile="fadull-1.x3p")
  }
  x3p <- x3p_read("fadull-1.x3p")
  x3p_image(x3p, size=c(500,500), zoom=.8)
  x3p <- x3p_fuzzyselect(x3p, update=TRUE, col="#FF0000")
  logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
  x3p_image(logo, size=c(500,500), zoom = 1)
  x3p_fuzzyselect(logo, update=TRUE, col="#00FF00")
}  
## End(Not run)
```
### x3p_get_scale

**Check resolution of a scan**

**Description**

Scans in x3p format capture 3d topographic surfaces. According to ISO standard ISO5436 - 2000 scans are supposed to be captured in meters. For microscopic images capture in meters might be impractical.

**Usage**

```r
x3p_get_scale(x3p)
```

**Arguments**

- `x3p`  
  object

**Value**

numeric value of resolution per pixel

### x3p_image

**Plot x3p object as an image**

**Description**

Plot x3p object as an image

**Usage**

```r
x3p_image(
  x3p,  
  file = NULL,  
  col = "#cd7f32",  
  crosscut = NA,  
  ccParam = list(color = "#e6bf98", radius = 5),  
  size = c(750, 250),  
  zoom = 0.35,  
  multiply = 5,  
  update = FALSE,  
  ...  
)
```

```r
image_x3p(
  x3p,  
  file = NULL,
```
col = "#cd7f32",
crosscut = NA,
ccParam = list(color = "#e6bf98", radius = 5),
size = c(750, 250),
zoom = 0.35,
multiply = 5,
...)

Arguments

x3p x3p object
file file name for saving, if file is NULL the openGL device stays open. The file extension determines the type of output. Possible extensions are png, stl (suitable for 3D printing), or svg.
col color specification
crosscut crosscut index
ccParam list with named components, consisting of parameters for showing crosscuts: color and radius for crosscut region
size vector of width and height
zoom numeric value indicating the amount of zoom
multiply exaggerate the relief by factor multiply
update Boolean value indicating whether a scene should be updated (defaults to FALSE). If FALSE, a new rgl device is opened.
...
not used

Examples

## Not run:
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
x3p_image(logoplus, size = c(741, 419), zoom=0.5)
# add crosscut:
logoplus <- x3p_add_hline(logo, yintercept = 50*.645e-6, color = "#e6bf98", size = 5)
x3p_image(logoplus, size = c(741, 419), zoom=0.5)
## End(Not run)

x3p_interpolate Interpolate from an x3p object

Description

An interpolated scan is created at specified resolutions resx, resy in x and y direction. The interpolation is based on na.approx from the zoo package. It is possible to create interpolations at a higher resolution than the one specified in the data itself, but it is not recommended to do so. x3p_interpolate can also be used as a way to linearly interpolate any missing values in an existing scan without changing the resolution.
Usage

\[x3p\_interpolate(x3p, resx = 1e-06, resy = resx, maxgap = 1)\]

\[\text{interpolate}\_x3p(x3p, resx = 1e-06, resy = resx, maxgap = 1)\]

Arguments

\(x3p\)  
x3p object

\(\text{resx}\)  
numeric value specifying the new resolution for the x axis.

\(\text{resy}\)  
numeric value specifying the new resolution for the y axis.

\(\text{maxgap}\)  
integer variable used in \text{na.approx} to specify the maximum number of NAs to be interpolated, defaults to 1.

Value

interpolated x3p object

Examples

\[
\text{logo} \leftarrow \text{x3p\_read}\left(\text{system.file("csafe\_logo.x3p", package="x3ptools")}\right)
\]

# resolution:
\[
\text{logo}\_\text{header}\_\text{info}\_\text{incrementX}
\]

# change resolution to 1 micron = 1e-6 meters
\[
\text{logo2} \leftarrow \text{x3p\_interpolate}\left(\text{logo}, \text{resx} = 1e-6\right)
\]

\[
\text{logo2}\_\text{header}\_\text{info}\_\text{incrementX}
\]

x3p\_lighter

Lighten active rgl object

Description

Make the currently active rgl object lighter. Adds a light source. Up to eight light sources can be added. Alternatively, any rgl light source can be added (see \text{light3d}).

Usage

\[x3p\_lighter()\]

Examples

\[
\text{x3p} \leftarrow \text{x3p\_read}\left(\text{system.file("sample\_land.x3p", package="x3ptools")}\right)
\]

## Not run:
\[
\text{x3p\_image}\left(\text{x3p}\right) \# \text{run when rgl can open window on the device}
\]

\[
\text{x3p\_lighter}\left(\right) \# \text{add a light source}
\]

## End(Not run)
### x3p_mask_legend

**Description**

Retrieve color definitions and annotations from the mask. If available, results in a named vector of colors.

**Usage**

```r
x3p_mask_legend(x3p)
```

**Arguments**

- `x3p`  
  x3p object with a mask

**Value**

named vector of colors, names show annotations. In case no annotations exist NULL is returned.

**Examples**

```r
x3p <- x3p_read(system.file("sample-land.x3p", package="x3ptools"))
x3p_mask_legend(x3p) # annotations and color hex definitions
```

### x3p_mask_quantile

**Description**

For each x value of the surface matrix add a region to the mask of an x3p object corresponding to the area between two specified quantiles.

**Usage**

```r
x3p_mask_quantile(
  x3p,
  quantiles = c(0.25, 0.75),
  color = "red",
  annotation = "quantile-region"
)
```
Arguments

- **x3p**: x3p object
- **quantiles**: vector of quantiles between which surface matrix values are included in the mask
- **color**: name or hex value of color
- **annotation**: character value describing the region

Value

- x3p object with changed mask

---

**x3p_modify_xml**  
Modify xml elements meta information in x3p object

Description

Identify xml fields in the meta file of an x3p object by name and modify content if uniquely described.

Usage

```r
x3p_modify_xml(x3p, element, value)
```

Arguments

- **x3p**: x3p object
- **element**: character or integer. In case of character, name of xml field in the meta file. Note that element can contain regular expressions, e.g. "*" returns all meta fields. In case of integer, element is used as an index for the meta fields.
- **value**: character. Value to be given to the xml field in the meta file.

Value

- x3p object with changed meta information

Examples

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
x3p_show_xml(logo, "creator")
x3p_modify_xml(logo, "creator", "I did that")
x3p_show_xml(logo, 20)
x3p_modify_xml(logo, 20, "I did that, too")
```
### x3p.m_to.mum

**Convert x3p header information to microns from meters**

**Description**

ISO standard 5436_2 asks for specification of values in meters. For topographic surfaces collected by microscopes values in microns are more readable. Besides scaling the values in the surface matrix, corresponding increments are changed to microns as well.

**Usage**

```r
x3p_m_to_mum(x3p)
```

**Arguments**

- `x3p`: x3p file with header information in meters

**Value**

x3p with header information in microns

### x3p_read

**Read an x3p file into an x3p object**

**Description**

Read file in x3p format. x3p formats describe 3d topological surface according to ISO standard ISO5436 – 2000. x3p files are a container format implemented as a zip archive of a folder consisting of an xml file of meta information and a binary matrix of numeric surface measurements.

**Usage**

```r
x3p_read(file, size = NA, quiet = T, tmpdir = NULL)
```

**Arguments**

- `file`: The file path to the x3p file, or an url to an x3p file
- `size`: size in bytes to use for reading the binary file. If not specified, default is used. Will be overwritten if specified in the xml meta file.
- `quiet`: for url downloads, show download progress?
- `tmpdir`: temporary directory to use to extract the x3p file (default NULL uses tempdir() to set a directory).
Value

x3p object consisting of a list of the surface matrix and the four records as specified in the ISO standard

Examples

logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))

---

**x3p_read_dat**

*Read data from an x-y-z file*

**Description**

Read data from an x-y-z file

**Usage**

x3p_read_dat(dat, delim = " ", col_names = FALSE)

**Arguments**

- **dat**: path to the x-y-z file
- **delim**: character determining delimiter
- **col_names**: logical value - does the first line of the file contain the column names? Default is set to FALSE.

**Value**

x3p object

---

**x3p_read_plux**

*Read information from plux file*

**Description**

plux files are zip containers of 3d topographic scans in a format proprietary to Sensofar®. One of the files in the container is the file index.xml which contains meta-information on the instrument, scan settings, date, and creator. This information is added to the x3p meta-information.

**Usage**

x3p_read_plux(plux)

**Arguments**

- **plux**: path to plux file
Value

xml of general information as stored in the plux file

---

**x3p_rotate**

*Rotate an x3p object*

---

**Description**

Rotate the surface matrix of an x3p object. Also adjust meta information.

**Usage**

```r
x3p_rotate(x3p, angle = 90)
rotate_x3p(x3p, angle = 90)
```

**Arguments**

- `x3p`: x3p object
- `angle`: rotate counter-clockwise by angle degrees given as 90, 180, 270 degree (or -90, -180, -270).

**Examples**

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
dim(logo$surface.matrix)
## Not run:
x3p_image(logo)
## End(Not run)

# rotate the image by 90 degrees counter-clockwise:
logo90 <- x3p_rotate(logo, 90)
dim(logo90$surface.matrix)
## Not run:
x3p_image(logo90)
## End(Not run)
```
Sample from an x3p object

Usage

x3p_sample(x3p, m = 2, mY = m, offset = 0, offsetY = offset)
sample_x3p(x3p, m = 2, mY = m, offset = 0, offsetY = offset)

Arguments

x3p x3p object
m integer value - every mth value is included in the sample
mY integer value - every mth value is included in the sample in x direction and every mYth value is included in y direction
offset integer value between 0 and m-1 to specify offset of the sample
offsetY integer value between 0 and mY-1 to specify different offsets for x and y direction

Value
down-sampled x3p object

Examples

go <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
dim(go$surface.matrix)
# down-sample to one-fourth of the image:
go4 <- x3p_sample(go, m=4)
dim(go4$surface.matrix)
## Not run:
x3p_image(go)
x3p_image(go4)
## End(Not run)
x3p_scale_unit

Scale x3p object by given unit

Description

x3p objects can be presented in different units. ISO standard 5436_2 asks for specification of values in meters. For topographic surfaces collected by microscopes values in microns are more readable. This functions allows to convert between different units.

Usage

x3p_scale_unit(x3p, scale_by)

Arguments

x3p object in x3p format, 3d topographic surface.
scale_by numeric value. Value the surface to be scaled by. While not enforced, values of scale_by make most sense as multiples of 10 (for a metric system).

Value

x3p with header information in microns

Examples

logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
logo # measurements in meters
x3p_scale_unit(logo, scale_by=10^6) # measurements in microns

x3p_select

Draw rectangle on the mask of an x3p file using rgl

Description

Interactive selection of rectangular area on the mask of an x3p object. Once the function runs, the active rgl window is brought to the front. Select the window with a click, then use click & drag to select a rectangular area. On release, this area is marked in the mask and (if update is TRUE) appears in the selection color in the active rgl window.

Usage

x3p_select(x3p, col = "#FF0000", update = TRUE)
**Arguments**

- **x3p**: x3p file
- **col**: character value of the selection color
- **update**: boolean value, whether the rgl window should be updated to show the selected rectangle

**Value**

x3p file with selection in mask

**Examples**

```r
## Not run:
if (interactive) {
  if (!file.exists("fadul1-1.x3p")) {
    file <- "2d9cc51f-6f66-40a0-973a-a9292db7e36d"
    download.file(file.path(url, file), destfile="fadul1-1.x3p")
  }
  x3p <- x3p_read("fadul1-1.x3p")
  x3p_image(x3p, size=c(500,500), zoom=.8)
  x3p <- x3p_select(x3p, update=TRUE, col="#FF0000")

  logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
  x3p_image(logo, size=c(500,500), zoom = 1)
  x3p_select(logo, update=TRUE, col="#00FF00")
}
## End(Not run)
```

---

**x3p_show_xml**

*Show xml elements from meta information in x3p object*

**Description**

Identify xml fields by name and show content.

**Usage**

```r
x3p_show_xml(x3p, element)
```

**Arguments**

- **x3p**: x3p object
- **element**: character or integer (vector). In case of character, name of xml field in the meta file. Note that element can contain regular expressions, e.g. ".*" returns all meta fields. In case of integer, element is used as an index vector for the meta fields.
Value

list of exact field names and their contents

Examples

```
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
x3p_show_xml(logo, "creator") # all fields containing the word "creator"
x3p_show_xml(logo, "axis")
x3p_show_xml(logo, "CZ.AxisType")
# show all fields:
x3p_show_xml(logo, ")")
# show first five fields
x3p_show_xml(logo, 1:5)
```

---

### x3p_snapshot

**Take a snapshot of the active rgl device and save in a file**

**Description**

Make a snapshot of the current rgl device and save it to file. Options for file formats are png, svg, and stl (for 3d printing).

**Usage**

```
x3p_snapshot(file)
```

**Arguments**

- `file` file name for saving. The file extension determines the type of output. Possible extensions are png, stl (suitable for 3d printing), or svg.

---

### x3p_to_df

**Convert an x3p file into a data frame**

**Description**

An x3p file consists of a list with meta info and a 2d matrix with scan depths. `fortify` turns the matrix into a data frame, using the parameters of the header as necessary.

**Usage**

```
x3p_to_df(x3p)
```

**Arguments**

- `x3p` a file in x3p format as returned by function `x3p_read`
Value

data frame with variables x, y, and value and meta function in attribute

Examples

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
logo_df <- x3p_to_df(logo)
head(logo_df)
```

---

**x3p_transpose**

Transposes an x3p object

### Description

Transpose the surface matrix of an x3p object. Also adjust meta information.

### Usage

```r
x3p_transpose(x3p)
```

### Arguments

- `x3p`: x3p object

### Examples

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
dim(logo$surface.matrix)
## Not run:
x3p_image(logo)
## End(Not run)

# transpose the image
logotp <- x3p_transpose(logo)
dim(logotp$surface.matrix)
## Not run:
x3p_image(logotp)
## End(Not run)
```
x3p_trim_na

Trim rows and columns with missing values only from an x3p

Description
Trims rows and columns from the edges of a surface matrix that contain missing values only.

Usage
x3p_trim_na(x3p, ratio = 1)

Arguments
- **x3p**: x3p object
- **ratio**: ratio between zero and one, indicating the percent of values that need to be missing in each row and column, for the row or column to be removed

Value
x3p object of the same or smaller dimension where missing values are removed from the boundaries

Examples
```
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
logo$surface.matrix[logo$surface.matrix == median(logo$surface.matrix)] <- NA
x3p_trim_na(logo) # reduced to dimension: 668 by 268
```

x3p_write

Write an x3p object to a file

Description
Write an x3p object to a file

Usage
x3p_write(x3p, file, size = 8, quiet = F)
write_x3p(x3p, file, size = 8, quiet = F)

Arguments
- **x3p**: x3p object
- **file**: path to where the file should be written
- **size**: integer. The number of bytes per element in the surface matrix used for creating the binary file. Use size = 4 for 32 bit IEEE 754 floating point numbers and size = 8 for 64 bit IEEE 754 floating point number (default).
- **quiet**: suppress messages
Examples

```r
logo <- x3p_read(system.file("csafe-logo.x3p", package="x3ptools"))
# write a copy of the file into a temporary file
x3p_write(logo, file = tempfile(fileext="x3p"))
```
